

# Facebook Messenger supports sharing HD videos and 360-degree photos

Facebook finally improved the quality of video sharing and photo sharing via their Messenger chat application.

If you're still hungry to share HD videos with friends, you'll be happy to know that Facebook finally improves the quality of video sharing and photo sharing via their Messenger chat application. Now you can freely send as many 360 photos to your friends.

To share 360 photos, you just need to hold the phone around to capture and send. HD videos can be shared via videos saved on the phone or taken from Newsfeed.

There is one thing to keep in mind for those who like HD videos as follow Facebook, you can only send and receive 720p videos. Those who want 1080p videos will probably be disappointed.

## *Already able to share 360 photos*

These updates come with a number of improvements that Facebook recently released to Messenger, such as 4K photo sharing last year. However, the update this time is difficult as the previous time, that your phone must be able to record HD video or take 4K photos to send it via Messenger.

If your phone has enough power - and according to camera reviews on current Android and iPhone devices, it's not uncommon - then sharing photos and videos via Messenger will no longer be boring.

360 photos can be shared globally, and HD videos are available in some countries, on both iOS and Android.
