

Facebook upgraded web chat features, more visible than online users

In the early afternoon of today (Vietnam time), social network Facebook has simultaneously upgraded its web-based chat feature. With the advantage of being the largest social network in the world, Facebook chat feature can be considered as the fastest and most convenient messaging application today. The chat frame on the home page is placed along the right side.

In the early afternoon of today (Vietnam time), social network Facebook has simultaneously upgraded its web-based chat feature. With the advantage of being the largest social network in the world, Facebook chat feature can be considered as the fastest and most convenient messaging application today. The chat frame on the home page is placed along the right side.

Previously, the chat frame only showed users who were online (*online*), unable to distinguish which users were using the web and mobile. This new upgrade displays more details, so you can know if your friends are using a computer or a mobile device.

In addition to the constantly updated features, Facebook also pays great attention to chat and chat on its platform. They are constantly investing in building **Messenger apps** on **iOS** and **Android**, upgrading web chat capabilities.
