

# Fall out on the pretext that South Korea insists on installing wi-fi on airplanes

Korean Air's explanation - Big Korean airline will make many people not be surprised.

In modern life, we are often "attached" to our smartphone or computer at any time. It is difficult for many people to sit on airplanes for several hours while traveling without using them.

Today there are many airlines that offer **wifi** services **on the plane** , allowing customers to access the internet.

Besides, there are certain airlines outside this modern trend. There are quite a number of reasons to explain this but perhaps the explanation of Korean Air - South Korea's major airline will make many people not be surprised: "*familiar and miserable happiness.*"

Dante Dionne, a technology developer with Korean Air, said: "*I believe that passengers desire that the services on airplanes and below ground are no different, including internet choices. In Korea, the terrestrial internet network is extremely advanced (higher than the average of the US), so passengers traveling to the plane must experience slow wifi, which is very frustrating, which is the main reason why Korean Air does not install wifi in the aircraft* ".

Isn't the internet on the plane at a few thousand meters high really "crawling"?

Although the internet on the plane is not as fast as on the ground, it is not to the point of "crawling". The internet on the plane is not born to serve high demand like watching online videos, playing good online games to download many things. That network is mostly for the needs of email, web downloads or the like.

With future technological advances, we can absolutely hope for a high speed internet network. At that time, Korean Air could be installed to meet the high demands of difficult customers and help us have great experiences on every flight.
