

Features to look forward to in the upcoming AirPods Pro 3

AirPods Pro 3 will launch in September, likely with new chip and improved design.

Apple is preparing for the launch of AirPods Pro 3 in September, at the same time as the iPhone 17 series. Although AirPods Pro 2 is still being improved through software updates, this new hardware version promises to bring many outstanding features.

AirPods Pro 3

New H3 Chip

According to Bloomberg's Mark Gurman, the AirPods Pro 3 will feature a brand new H3 chip. While some of Apple's chips typically offer only minor improvements, the AirPods Pro's H1 chip was three years old before the H2 was introduced.

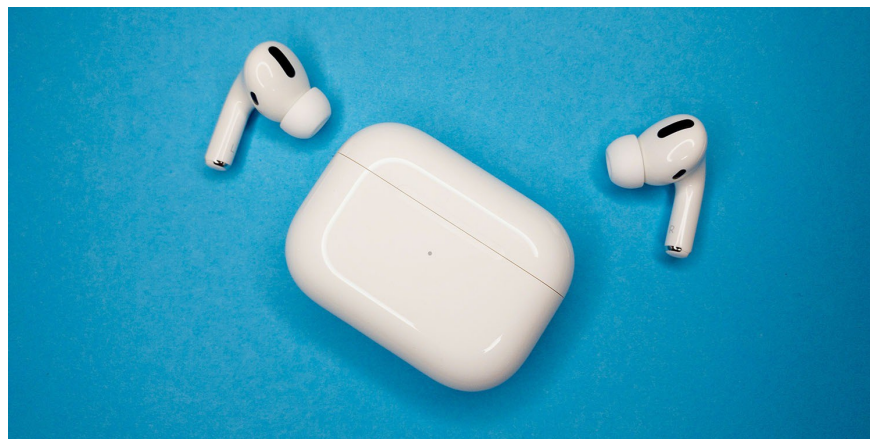

AirPods Pro 3 will be equipped with the new H3 chip.

This wait has led to significant upgrades to the H-series chips. The H2 chip has improved audio experience and doubled noise cancellation compared to the previous generation. With the H3 chip, users can expect many new features and improved battery life.

New design

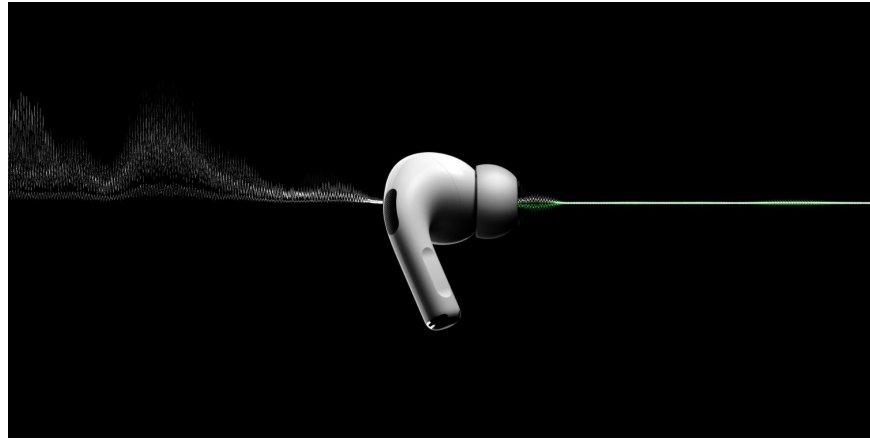

Gurman also said the AirPods Pro 3 will have a new design, although specifics have yet to be announced. While we don't expect major changes, there may be some minor tweaks to the size and fit.

Upgraded noise cancellation feature

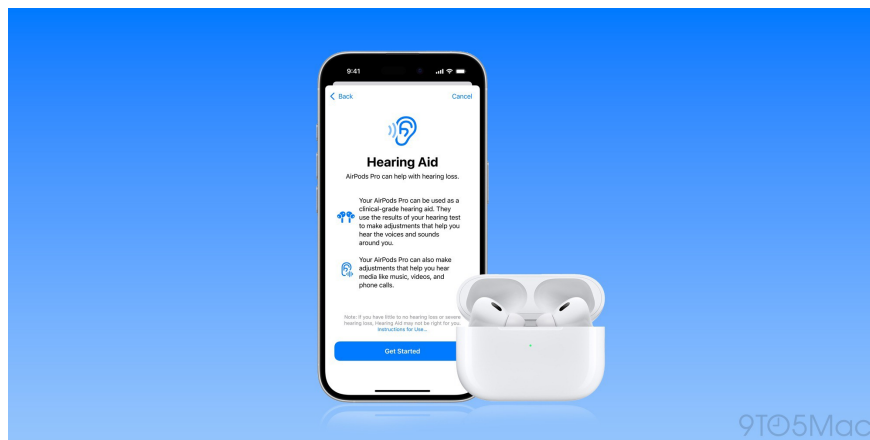

One of the highlights of the AirPods Pro 2 is the Active Noise Cancellation (ANC) feature. According to reports, the AirPods Pro 3 will have improved ANC, promising a better experience thanks to the H3 chip.

AirPods Pro 3 will feature improved ANC.

New health features

While details are limited, Gurman did reveal that Apple is working on a number of health features for future AirPods, including heart rate monitoring and temperature sensors. Heart rate monitoring could be integrated into the AirPods Pro 3.

Heart rate monitoring may be built into AirPods Pro 3.
