

Find specific words on the web with iOS and Android

You can get used to the find command when using the web browser on the desktop. But how to perform the same action on a mobile device like an iPhone or Android smartphone in a web browser?

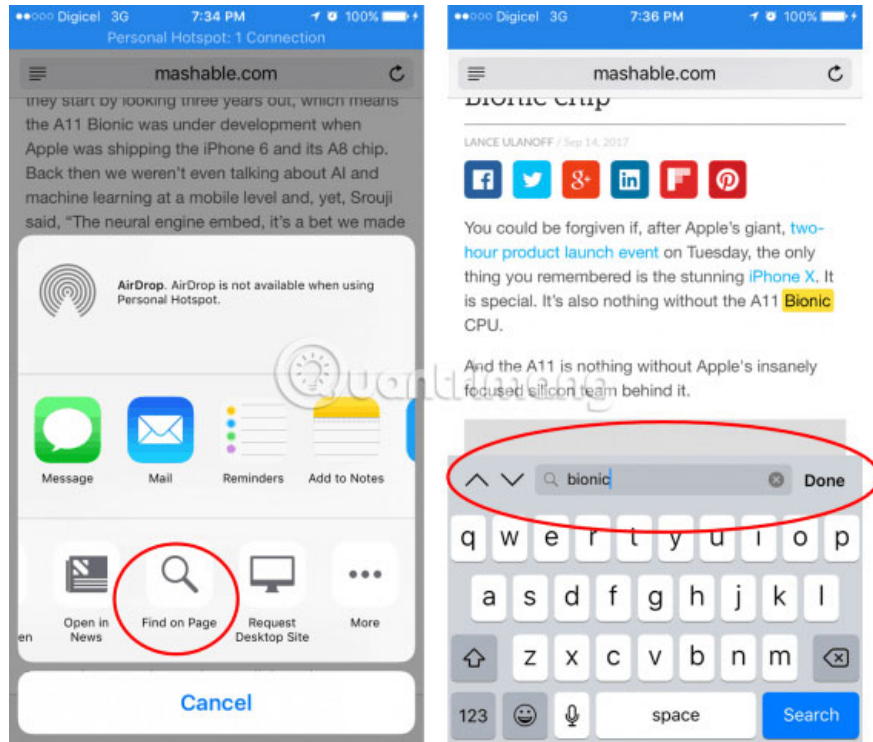

You can get used to the find command when using the web browser on the desktop, by pressing **Control + F** (PC) or **Command + F** (Mac) on the website to find specific words or statements. But how to perform the same action on a mobile device like an iPhone or Android smartphone in a web browser? Let's find out through the following article!

How to search the site using the Find menu in iOS and Android

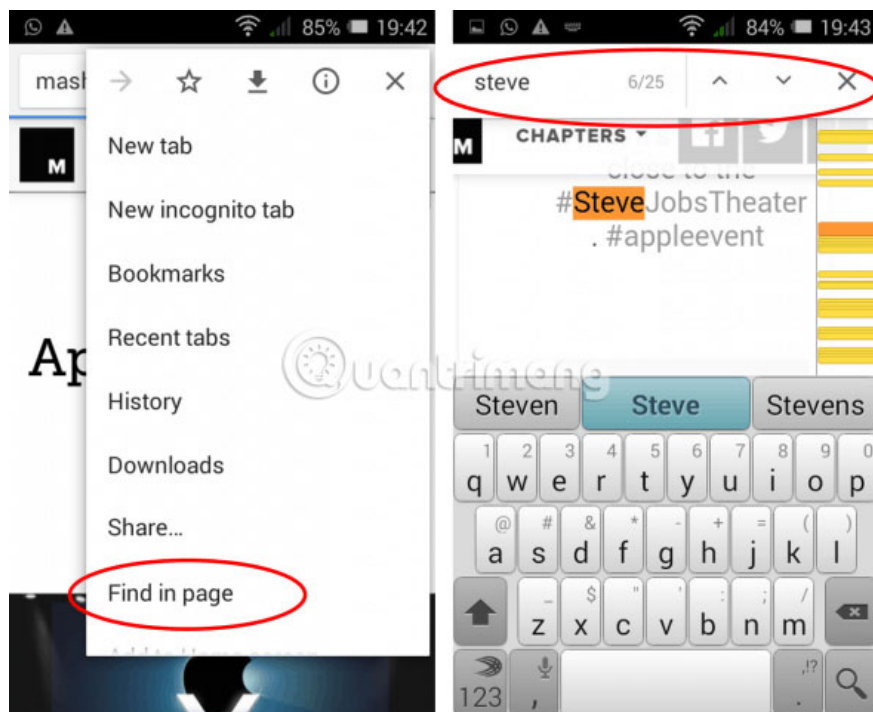

Apple's Safari for iOS provides many methods to perform searches on the site. First, load the website, click on the address bar, then enter the word you are looking for. A table with word suggestions will appear. At the bottom of the list will be a section named **On This Page** with the **Find** option. Click **Find**, then you will see the highlighted word, along with the search box to find other words on the page.

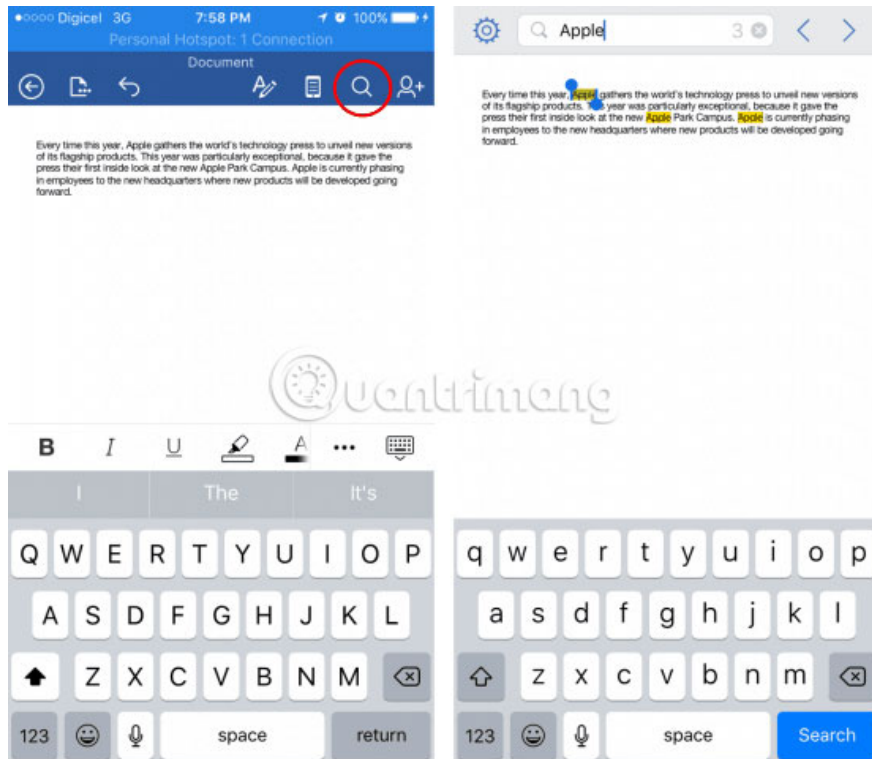

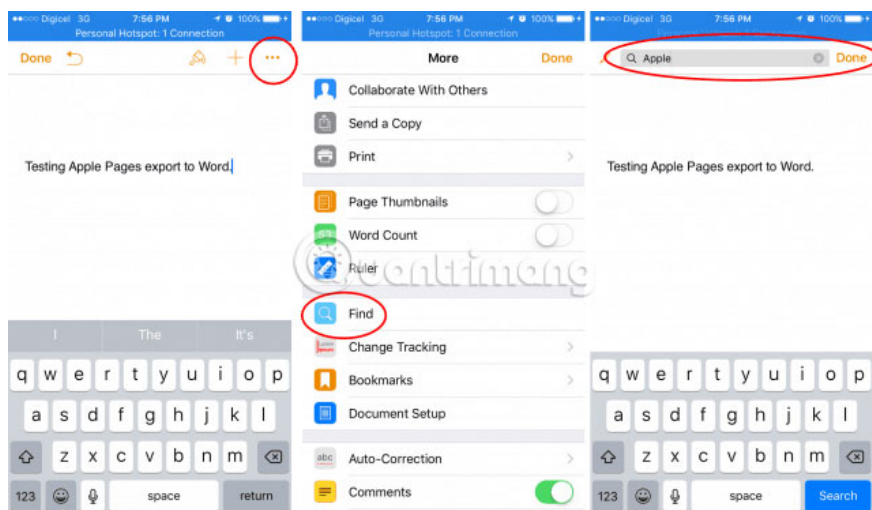

Another way you can search for words on a page is to use the **Share** table . Touch it at the bottom of the screen, swipe left, then press **Find on page** . Enter the word you are looking for. You can use the next button to search on the document.

Searching on the page in the Google Chrome browser with an Android device is a little easier; Touch the vertical 3-dot mark in the upper right corner next to the address bar. Click on the **Find on page** menu, then enter your query.

Third-party applications may have built-in search functionality. In apps like **Word** and **Pages** for iOS, you can click the magnifying glass icon or click the dots icon in the app.

Hope you are successful.
