

# Fix taskbar not working on Windows 10

This article I will guide six ways to fix the taskbar (taskbar) error in Windows 10 not working, with 5 easiest methods.

If the Windows 10 **taskbar is** not working then this article is exactly for you, freetuts has compiled how to fix common taskbar problems such as freezing or hiding automatically. work. These tricks will definitely bring the fully functional taskbar back to work on Windows 10.

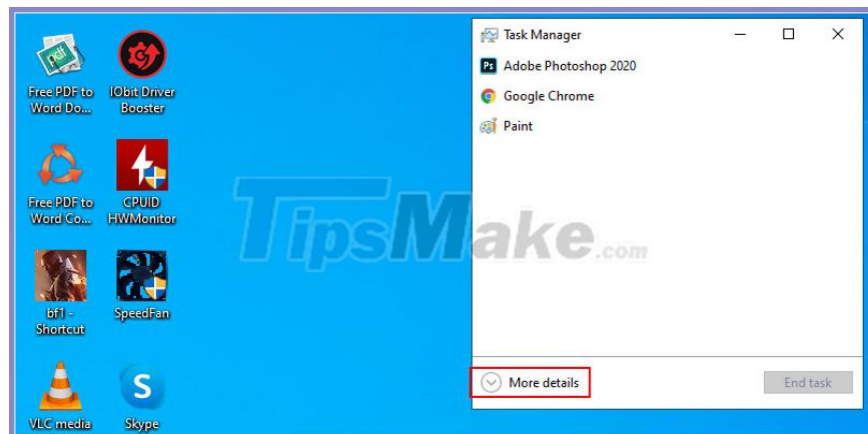

## 1. Restart Explorer to fix Taskbar not working

Explorer is an important component of the operating system, it includes desktop icons / shortcuts, familiar Windows / Start icons and the Taskbar (taskbar). In short, Explorer contains almost everything visible on the Desktop, so restarting it will make it easy to restore your taskbar.

### 1. Restart Windows Explorer using Task Manager

The easiest way when you encounter any taskbar problem is to restart **explorer.exe** process . This is a Windows UI controller that includes the **File Explorer** app as well as the taskbar and Start **Menu** . Hence restarting it can clear every little glitch. To restart this process, follow the steps below:

**Step 1:** Press the key combination `Ctrl + Shift + Esc` to launch the **Task Manager** .

**Step 2:** Click the **Processes** tab , in the **Name** column , find **Windows Explorer**, then right-click and select **Restart** .

After performing the above action, the **Taskbar** will disappear for a while or perhaps just a few seconds, then it will return to normal operation.

If this doesn't work, you can also try logging out and re-logging in your user account. Don't forget to restart your PC is always a good idea if you use your computer continuously for many hours.

## 2. Restart Windows Explorer using CMD

All programs can be started or forced to stop working by cmd, let's use this tool to restart **Explorer.exe**.

**Step 1:** Press the key combination Windows + Rand then type: *cmd*

Then press the key combination Ctrl + Shift + Enter to open **CMD** as administrator.

**Step 2:** Once **CMD** is launched, enter this command to end **Explorer**:

```
taskkill / f / im explorer.exe
```

Then press **Enter** to run the command.

**Step 3:** Next to the taskbar, the background and desktop icons will disappear. Enter the following syntax to start **Explorer** again :

```
explorer.exe
```

Then you also press **Enter** to run the command and restart **Explorer** .

After restarting **Explorer** , your **taskbar** will most likely return to normal operation, otherwise try the second method below.

## 2. Turn off some programs that start with Windows

If your computer has a weak configuration and runs too many programs that start with Windows, it may cause the Taskbar's response time to be too long and cause errors. Try disabling applications that start with Windows to fix the error.

Refer to the article on how to turn on / off the program that starts with Windows to see instructions to turn off applications that start with Windows.

## 3. Make sure you have the latest version of Windows 10

Checking for updates is one of the most important keys to solving any Windows problem. Each update comes with lots of solutions for errors that appear. Many people have resolved the problem with Windows operating system after they updated to the latest version, please update Windows according to the following instructions:

**Step 1:** Press the key combination Windows + I to open **Settings Apps**.

**Step 2:** Click **Update & Security**.

**Step 3:** Click **Check for updates**, if there is a new update, select confirm to download and install automatically.

After downloading and installing new updates, your computer will restart automatically. Now see if **the** taskbar is working again, if not, try the stronger measures below.

## 4. Use Virus / Windows Defender removal program

Virus or malware infection can also cause the taskbar not to work, if you suspect that your computer is infected with a virus, apply this method to fix the taskbar not working error.

### 1. Use Windows 10's built-in Antivirus: Windows Defender

Windows 10 has integrated a pretty good antivirus that is **Windows Defender** , normally if you don't make any impact, this antivirus automatically scans for Viruses regularly. However, this automatic scan can miss a lot of files and folders that may contain malware and Viruses, you can customize to do a deeper and deeper scan of your entire computer to check for the problem. .

**Step 1:** Press the key combination Windows + R to open the **Run** dialog box .

**Step 2:** Enter the following syntax and click **OK** to open **Windows Security** settings :

windowsdefender :

**Step 3:** Click on **Virus & threat protection** then select **Scan options** to customize Virus scan mode.

**Step 4:** Integrate select **Full scan** and then click **Scan now** to conduct virus scans and malware across the device's memory.

After the scan is complete, if it detects any document containing malicious code, the program will automatically process it. Now all you need to do is restart your computer to see the results.

## 2. Use a third-party antivirus program

However, many people think that free Windows Defender does not work as well as other antivirus programs, if you agree with this point of view, try the best antivirus software available today. Download settings and scan for Viruses to fix **Windows 10 taskbar not working error**.

## 5. Reinstall the new Windows 10 operating system

After applying the above four methods that you cannot fix the "**Windows 10 taskbar not working**" error , this is the last tough measure: **Reinstall the operating system**.

1. **Note:** This is a reluctant solution, only when you can't find any more ways to apply this method. Because your computer will lose all data in drive **C** (the partition containing the operating system) and it takes about 30 minutes to **reinstall the operating system** using Ghost Win method.

**Ghost Win** will be the fastest and most convenient solution right now, this is an extremely effective method to fix all errors on Windows operating system. As I have noted, you should consider carefully before ghosting the machine, please refer to the two articles below to know how to ghost the device and find the suitable ghost version.
