

Fixing slow laptop startup and long screen time issues.

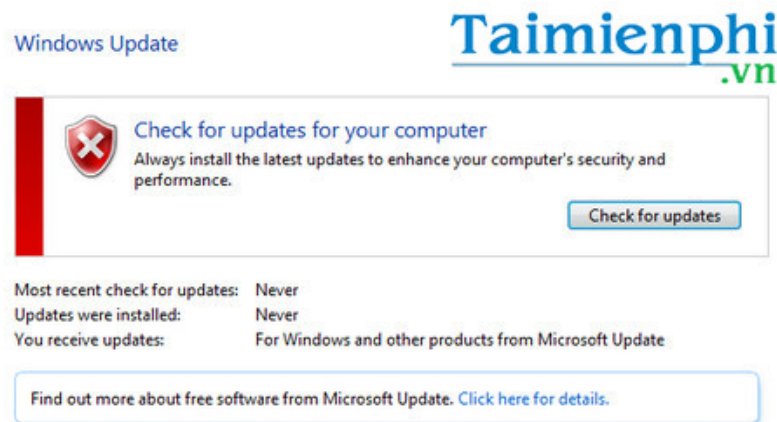

Laptops that start up slowly and take a long time to boot up can be due to various reasons, including Windows issues and hardware problems. This article will help you understand some of the causes and how to fix a laptop that takes a long time to boot up and won't enter Windows.

When encountering slow laptop startup issues, many people often choose to reinstall Windows because, after prolonged use, too many junk files accumulate, causing Windows to boot slowly. However, this method doesn't completely solve the problem. Reinstalling Windows only helps the laptop boot faster for about a month; after more use and installations, the slow startup problem will reappear. Therefore, before resorting to reinstalling Windows, you should try some of the following tricks to see if they can fix the slow laptop startup issue. These are also the methods that can most effectively improve and fix slow laptop startup problems, something that reinstalling Windows cannot do.

Fixing slow laptop startup and long screen time issues:

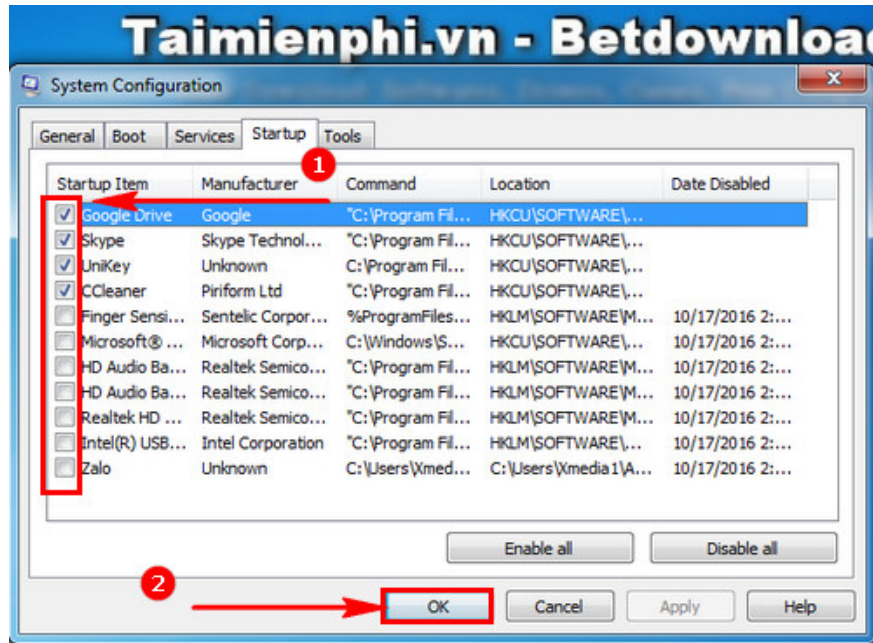

1. Turn off Windows Update :

The Windows Update tool, or Windows updates via the Control Panel, is the most common cause of slow computer startup. Microsoft sets this feature to "On" by default, prompting users to update to the latest Windows version, and the update process often takes place during the computer's shutdown and restart cycles. Therefore, users should disable Windows Update if they want their computer to start up faster. Furthermore, if you are using a non-licensed version of Windows, it's best to disable Windows Update to avoid errors during the Windows update process.

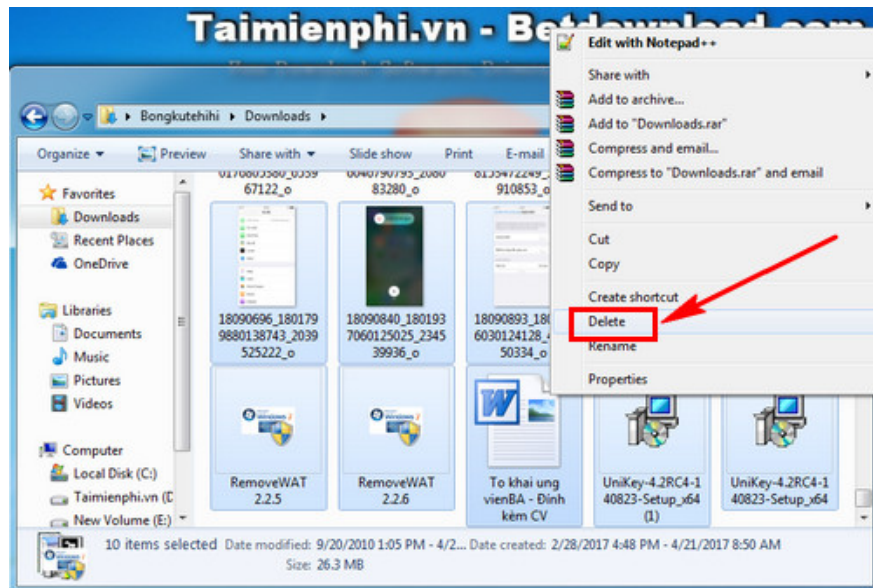

2. Disable applications that start automatically with your computer.

When you install popular software on your computer such as Unikey or Internet Download Manager, these programs usually start automatically with your computer. If you don't need to use these programs or tools frequently, you should disable them from starting automatically to reduce your laptop's boot time.

3. Delete unnecessary files.

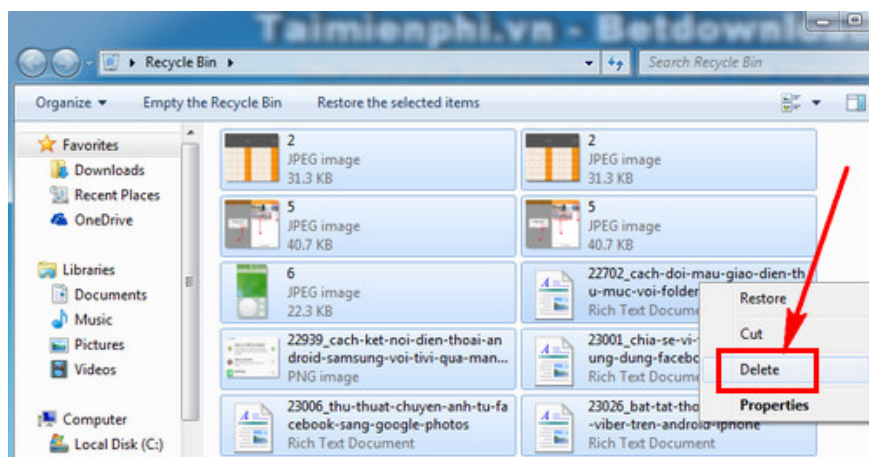

Installation files, images, and archive files that you download to your laptop can be the reason it runs slowly. Too many junk files can fill up your hard drive and slow down your laptop's startup time. Regularly cleaning up and deleting these files will significantly speed up your computer's startup.

4. Delete files from the Recycle Bin.

After deleting the file using the method above, you need to perform an additional step of deleting junk files in the Recycle Bin to completely remove all data, because your Delete action only moves the files to the Recycle

Bin. To completely delete junk files from the Recycle Bin, you need to open **the Recycle Bin** and **delete** all files.

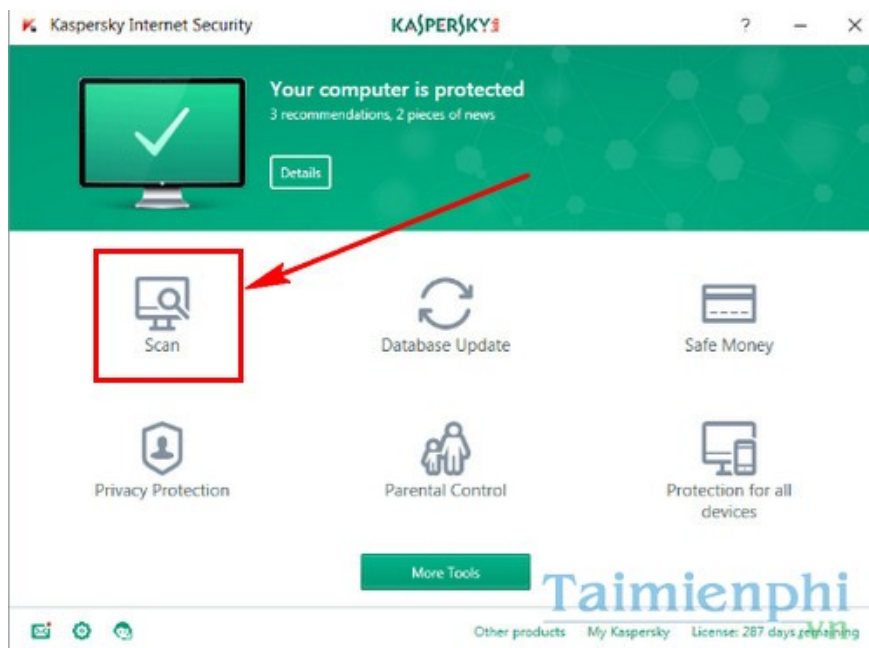

You can also **right-click** on the Recycle Bin and select **Empty Recycle Bin** to quickly delete all files inside it.

5. Eliminate viruses regularly.

Kaspersky Internet Security: Download KIS

Viruses, Trojans, or malicious files on the internet are common causes of slow laptop startup. You should install top-tier antivirus software like Kaspersky Internet Security on your computer to prevent and remove infected files. If your laptop is running slowly, install Kaspersky Internet Security and then select **Scan to allow the** software to scan your entire computer and eliminate harmful viruses.

These are 5 ways to fix slow laptop startup issues that users should try if their computer is experiencing this problem.

Additionally, uninstalling software from your computer is also a good option to help your laptop start up faster. In fact, uninstalling software is very simple; it's a trick every computer user should know. Just imagine, not knowing how to uninstall software from your computer would be a disaster. Your computer's memory would be full with a host of unnecessary programs. Even dangerous programs containing viruses and spyware would be a problem.
