

Focus Mode is ready with many new features worth experiencing

Android 10 is the version of Android that has received the most positive feedback from Google. This is thanks to the appearance of a series of new and extremely useful features for users, including the Focus Mode feature.

Android 10 is the version of Android that has received the most positive feedback from Google. This is thanks to the appearance of a series of new and extremely useful features for users, including the Focus Mode feature.

Focus Mode is basically a utility that enhances user focus when working by enabling notification control as well as background activity of all applications on the device, thereby minimizing time when using phone screen when not needed - factors that affect concentration. In a nutshell, you just need to pick the apps that often distract you and pause them.

When placing an application in Focus Mode, it means that you will not receive any notifications, and cannot use the application until Focus Mode is turned off. This is especially useful in case you do not want to receive messages or notifications from social networking applications while working, while still not needing to switch

the device to the sewing machine mode (turn off all connect on the device). In short, you will be able to control anything you want to see or create notifications on your Android phone or tablet.

According to a notice from Google, the Focus Mode feature is currently out of beta, ready to use with full support. Based on feedback from beta users, Google has added some practical new features to Focus Mode. For example, you will now have the option to automatically turn on and off Focus Mode according to the schedule and specific time frame previously selected. And the new Take Break feature will allow you to schedule a Focus Mode interrupt.

Focus Mode is currently available on all Android 9 and Android 10 devices with Digital Wellbeing and Parental Controls installed. This feature is part of the Digital Wellbeing project implemented by Google itself, focusing on research on technologies that reduce screen time when not needed.

TipsMake.com has an article on how to activate Focus Mode, you can refer to it.
