

Future iPhone will not have rabbit ears thanks to this unique design?

The idea of ??designers at Phone Designer may help the future iPhone to have a completely new design, unlike any current smartphone.

The idea of ??designers at Phone Designer may help the future iPhone to have a completely new design, unlike any current smartphone. There will be no rabbit ears, water droplets or notch but a wart, or extremely unique and impressive wart.

In this design, the camera cluster is positioned above the main screen part with one block attached to the body, not the pop-up type like Vivo Nex or Oppo Find X.

This protruding block makes users think of a raised wart on the top of the body.

This type of design is unique, but it seems that it will not be possible to use the protective cover and bring the uncomfortable feeling to the user when putting the phone into the bag or when applying the headset when making and receiving calls.

It is possible that this is a fun joke by designers from Phone Designer as the trend of innovative design for traditional phones is going strong.

But if Apple really intends to create an iPhone with such a wart design, it will certainly have to take into account the mechanical durability problem.

And if Apple does not follow the design from Phone Designer, there is some company that wants to make a breakthrough with this design somewhere.
