

Get color parameters more easily with ColorSchemer Studio

In the Design world, color is a very important factor that directly affects the quality and aesthetics of the product being created. If you want to know these parameters to be able to use, Color Schemer Studio will be a software worth your attention.

In the Design world, color is a very important factor that directly affects the quality and aesthetics of the product being created. If you want to know these parameters to be able to use, Color Schemer Studio will be a software worth your attention.

In addition to the ability to display color parameters in many different standard systems, Color Schemer Studio offers a lot of other cool features to get the exact parameters of any color displayed on your computer screen. The most special feature is the Color Mixer color mixing feature, taking one color parameter at any position in the PhotoSchemer image file .

After the installation process is completed, the program will start automatically. Right at the main screen of Color Schemer Studio, you will see the color swatch with the parameters shown in the left frame. Adjust the RGB parameters and especially S and L under the Adjust Color section to create a distinct and distinctive color. Corresponding to each adjustment, the Hex Value parameter will bring a different value. To copy that parameter to the clipboard, simply press the fourth icon from left to right. The color can then be used in each other graphic program through this HEX value.

Besides, Color Schemer Studio gives you many great features to get the HEX value of any color on the screen with the following three utilities:

- The Screen color picker (pen-shaped icon) allows you to immediately get the value of any color when you click anywhere on the computer screen.
- PhotoSchemer (eighth icon from left to right) helps you get the parameters of a color in any image file. After starting this feature, click on the Open line and select the image to take the color. Then left-click and move around the image to have the corresponding color value on the screen.
- The Color Mixer (a three-column color icon) allows users to create a new color based on the blending of selected colors with your style.

With what the show shows, Color Schemer Studio deserves to be in the collection of the most effective support tools for Designer.

The program is provided at the website: <http://www.colorschemer.com> with a capacity of about 2.26 MB, compatible with the Windows operating system. The commercial version costs \$ 49.99.
