

Getting familiar with the Pick Tool in CorelDraw

The Pick Tool is the most important tool in CorelDRAW. It's used to select objects. Read on to learn more about the Pick Tool in CorelDRAW.

If you're new to CorelDraw, the Pick Tool is used to select objects. Refer to the article "Getting acquainted with the Pick Tool in CorelDraw" below from TipsMake to learn about its location, keyboard shortcuts, and how to use it.

To download and install **CorelDraw** , click [here](#).

1. Getting familiar with the Pick Tool in CorelDraw

The Pick Tool is located in the upper corner of the Toolbox (this is the most important toolbar in CorelDraw. If you don't see the tool, go to **Window => Toolbars** and check **the Toolbox** option).

The shortcut to open the Pick Tool is **the Spacebar** (if you are typing, use the shortcut **Ctrl + Spacebar** to open the Pick Tool).

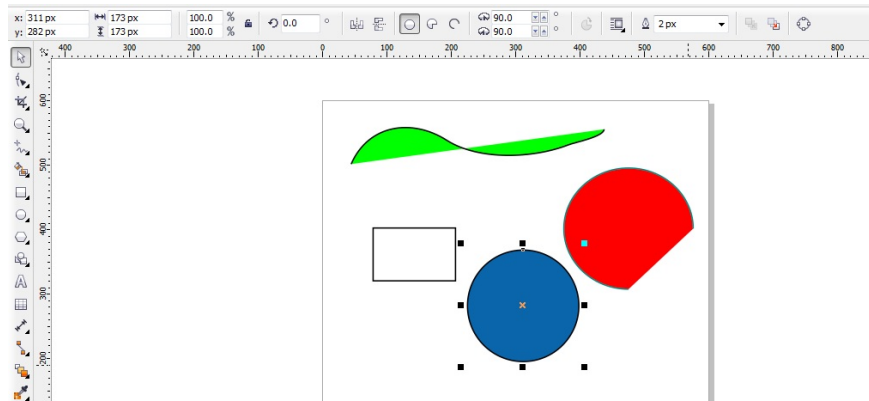

1.1 Using the Pick Tool to select objects

In CorelDraw, we must select an object before applying any changes. We can select a single object, a group of objects, or all objects on the page.

- Select an object:

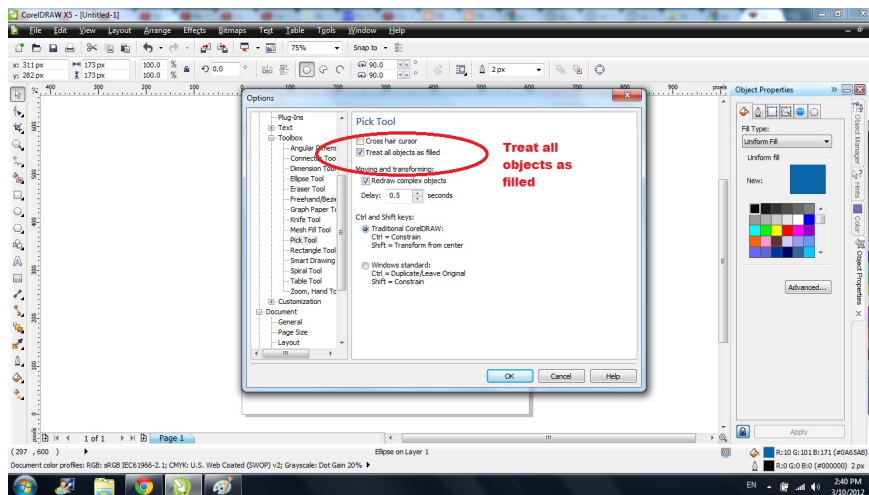

Click anywhere on the object that has already been filled with color to select it. If the object has not yet been filled with color, click on Outline to select and fill it with color.

A series of handles will appear around the object, indicating that the object has been selected. Click anywhere outside the object to deselect it. Double-click the object to activate the rotate tool.

- Select objects that do not fill color:

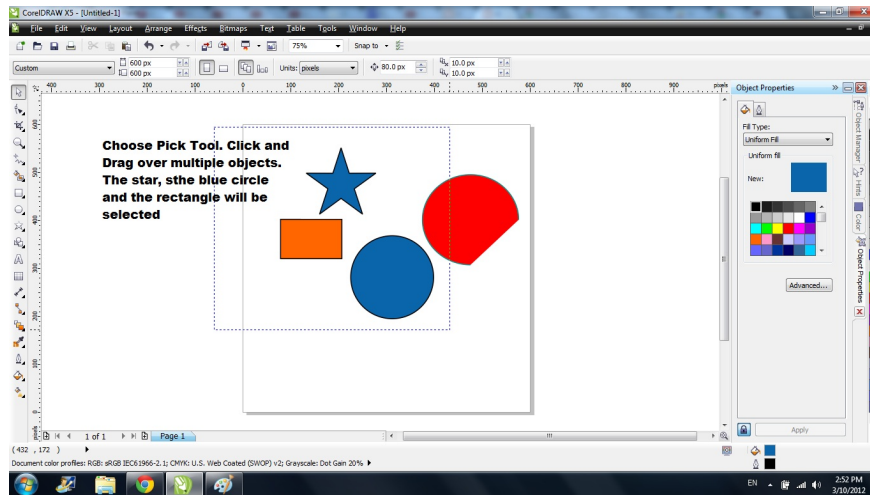

To select an object that shouldn't be filled with color, first click on Outline, then click anywhere within the object, select **Layout => Page Layout => Workspace => Toolbox => Pick Tool**. In the **Pick Tool** section, find and check the option **Treat All Objects**.

- Select multiple objects:

Select the Pick Tool, then click and drag across multiple different objects. All objects will be within the selected area. Release the mouse button, and handles will appear on the screen indicating the selected objects.

You can check the status bar to confirm the number of selected objects.

- Select multiple objects using the SHIFT key.

By selecting the Pick Tool, then clicking on an object to select it. Press and hold the Shift key to select a second object, and similarly for other objects. This is a useful solution for selecting multiple different objects in different locations on the page.

Use the keyboard shortcut **Ctrl + A** if you want to select all objects.

The article above, by TipsMake, has introduced you to the Pick Tool in CorelDraw, one of the CorelDRAW usage tips you should learn. Additionally, if you have any questions or concerns related to CorelDRAW , please leave your comments in the comment section below the article.

This version also has the ability to create 3D logos. You can learn how to create 3D logos using CorelDraw X6 to create the logo you want. The method **of creating 3D logos with CorelDraw X6** is specifically introduced on taimienphi.
