

# Google Chrome freezes after Windows 10 April 2018 update

Some users after updating the latest Windows 10 computer in April said there was a problem with Google Chrome

In a discussion on reddit, users confirmed that after booting, Chrome quickly froze and could not be used. These users have updated Windows 10 1803. It is not known how many machines are affected by this error.

It does not appear that this error is only available on the latest version of Google Chrome. A user described that both the machine is free and even Ctrl + Alt + Delt is not possible, can only turn on and off with the new power button. There is also no template for this error to occur and it appears very randomly, probably when opening a new tab, opening a new window or simply browsing the web.

Another user said that running Chrome in the background also caused other applications to freeze, including Visual Studio Code.

*The next version of Windows 10 will fix all errors*

'The VS Code I used is also stalled several times but there is always Chrome running in the background. There is no need to switch to Sleep mode or reboot, just unplug the source, and since the screen is then a miniature Chrome screen, it must be a Chrome-related error. '

There is no immediate solution, some suggestions for restarting the graphics driver by pressing the key combination Win + Ctrl + Shift + B will help the device run out.

Windows 10 April 2018 update will be released via Windows Update from 8/5. Perhaps this error, like all previous errors, will be fixed in this update.
