

Google Chrome is the king of speed in the real world!

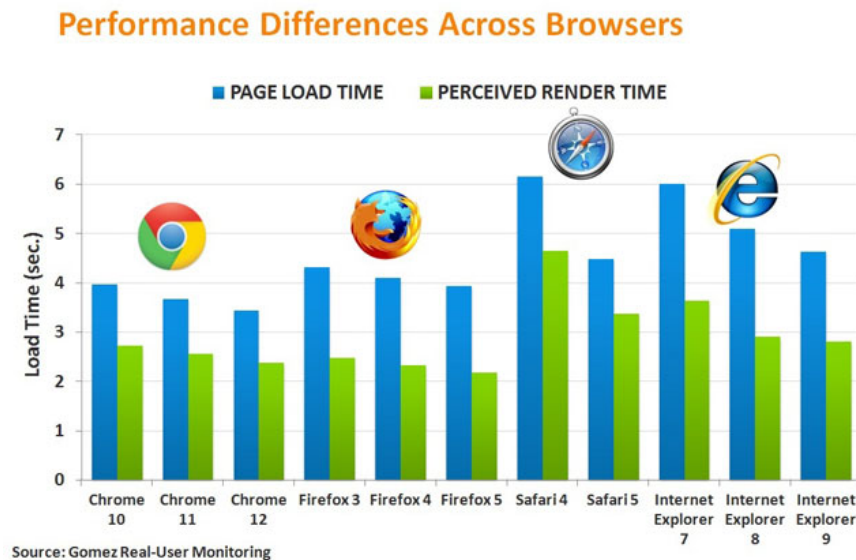

Once again Google Chrome reaffirmed its number one position in the speed race between browsers.

Once again Google Chrome reaffirmed its number one position in the speed race between browsers.

Recently *Gomez* - a software testing company has launched the fastest browser search project in the world. It sounds pretty boring and old, but these tests are not done in testlab anymore but are tested in normal use (real world).

The data of the study was collected within a month with 1.86 billion participants over 200 websites. Of course, they all use broadband so that the network speed does not affect the page load time of browsers.

Yes, the results of this survey are not surprising at all when the fastest browser in the 'real world' is Google Chrome. Following no one else but Mozilla Firefox, two wealthy Apple Safari and Microsoft Internet Explorer are still behind.

Google Chrome takes first place in page loading speed.

** Last week Google released Chrome 13, so it did not appear in this statistic.*

Through the chart, you can clearly see the page loading speed of Chrome 12 is about 3.4 seconds - surpassing all

other browsers. Mozilla's efforts have only helped Firefox 5 keep up with the speed of the old version of 10 that Google released a long time ago.

An interesting point is that while Firefox 5 loads pages slower than Chrome 12, it has the ability to process images to display information to users faster. This makes the final performance for the users of these two browsers equal.

Two products from technology giants: Apple, Microsoft are Safari and Internet Explorer, although they have made strong changes when new versions have significantly improved performance, but they still have to Long smoke smoke behind.
