Google is ready to push Google Chrome 15, which is currently in the dev channel, beta channel, allowing users to test new and smooth features before Chrome 15 reaches a stable channel for most users.

Google released **Chrome 15.0.874.0** for Windows and Chrome Frame, **15.0.874.1** for Linux and **15.0.874.3** for Mac. This is the upgraded version to beta channels.

The latest update of 3.6.0.0 V8 JavaScript and a lot of attached fixes. One notable change is that all Plugins are now hardware-accelerated by default, although this may be disabled.

The latest update also brings important security features, all users can now discover new phishing technology based on Chrome. This feature will try to determine if the user is at risk or in a state of fraud and it will try to minimize the damage.

So far, noticeable changes in Google Chrome 15, which users will first notice are the newly refurbished tab page and the integrated extensions management page on the main settings page. The new tab page separates the function between three separate tables.

The next Chrome version 15.0.874.x will probably move up to the next channel to release a more stable version. It will focus on stability and smoothness of features, and what users use. The expected application is to get the

final stable Chrome.

Google Chrome for Windows

Google Chrome for Linux

Google Chrome for Mac
