

Google is significantly enhancing its Flow AI tool.

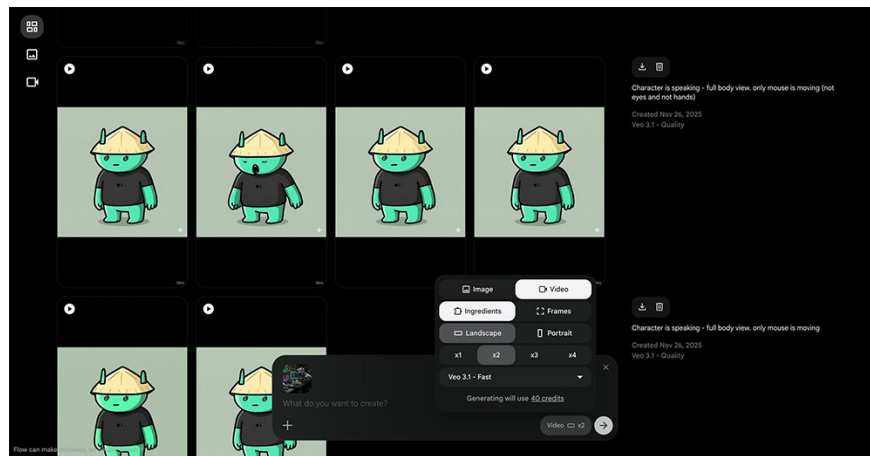

To optimize the workflow, the best features, including Whisk and ImageFX, are being integrated directly into Google Flow.

Google has just announced updates to its AI-powered image and video processing platform, Flow, making it easier to create complex layouts and enhance in-app content.

First, Google implemented a new user interface with simpler controls at the top to make image creation easier, as well as providing more flexible data management capabilities.

Google is also adding more natural and intuitive editing tools, including a simple selection tool to precisely select an area of an image and using conversational questions to prompt Flow to make adjustments.

Users can also create high-resolution images and use them as components in the Veo video creation process, all within the Flow system.

According to Google, to optimize the workflow, the best features, including Whisk and ImageFX, are being integrated directly into Flow. This allows you to create, edit, and animate everything in a unified workspace.

Starting in March, users will be able to transfer all Whisk and ImageFX projects and data directly into Flow.

This could be a significant and valuable feature for users, providing new options for creating eye-catching images using Google's latest artificial intelligence advancements.
