

Google provides security on new users' iPhones

Apple's new iPhone 6 has just launched, Google has announced that it will help users protect Gmail and documents when available on the device.

Apple's new iPhone 6 has just launched, Google has announced that it will help users protect Gmail and documents when available on the device.

Google announced a tool called *iOS Sync*, to enhance iPhone and iPad security for customers using *Google Apps* (*Google Apps for Government, education, work*).

Accordingly, when using *iOS Sync*, the security department will be able to establish access to the network safely, enforce other security policies such as using secure passwords, data encryption, blocking Steals email data and documents on computers.

Google Apps administrators can enable *iOS Sync* and manage mobility through the Google Apps administration interface. Users will be instructed to register the phone when accessing the company's Gmail or Drive. This will help keep information confidential.

iOS Sync can be compatible with both devices running iOS 7 and will be available next week.
