

Google unveiled some new features of Android Lollipop Wear for smartwatch

The updated Android 5.0 Lollipop for Android devices is probably not hot anymore, because recently Google has revealed some very attractive features that Lollipop will bring to the smartwatch running Android Wear. Most notable is the 2 features that monitor battery status and storage capacity on smartwatch.

The updated Android 5.0 Lollipop for Android devices is probably not hot anymore, because recently Google has revealed some very attractive features that Lollipop will bring to the smartwatch running Android Wear. Most notable is the 2 features that monitor battery status and storage capacity on smartwatch.

Monitor battery status and storage capacity

Tracking battery life on smartwatch is the same as a user checking on a smartphone or tablet, the content will be displayed as a chart and estimating battery life as well as checking which applications are "eating" battery. The Lollipop update for Android Wear includes a storage space monitoring utility and lets users know which apps are taking up the most space.

With the ability to enable music storage on smartwatch recently, this feature is very useful to inform users how much storage space they have. *Debugging* features via Bluetooth are also brought back on this new version.

Improved user interface

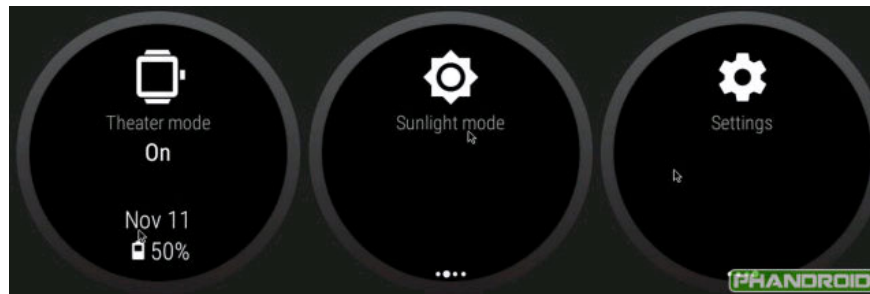

In addition to allowing users to customize the default skins available on smartwatch lines, users can now install 3rd party apps to be able to change the new interface to their preferences. Not only that, the new interface on the screen will bring more possibilities for users to adjust thanks to the settings menu. With this menu, weather reports will be displayed directly on the watch face, instead of the previous one, users must swipe through Google Now weather for weather information.

Review the missed notice cards

If unfortunately users accidentally delete a message and suddenly realized it is important, now on *Android Wear 5.0 Lollipop version* will help users recover by surfing the screen from the bottom up and will show issue card notifications that the user has deleted to be able to undo easily. We can say this is one of the brightest features updated on this new Android version.

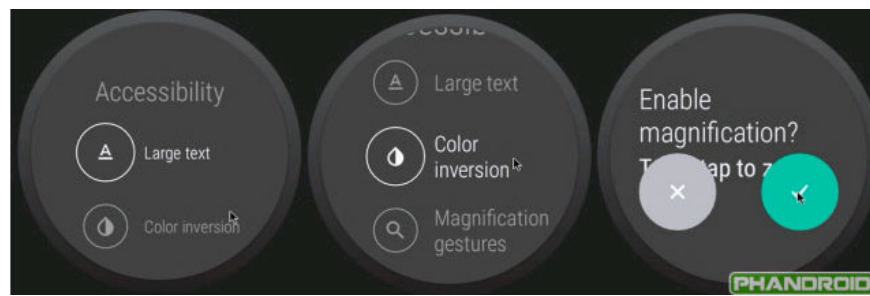

Customize screen brightness more easily

A smartwatch drawback when users use it is that the light is constantly playing on the screen, especially when users go to the movies and sit in the theater with the darkness around while the clock on your hand is bright , create an uncomfortable feeling for people around you. Not only that, users can hardly see the information from smartwatch when going outdoors.

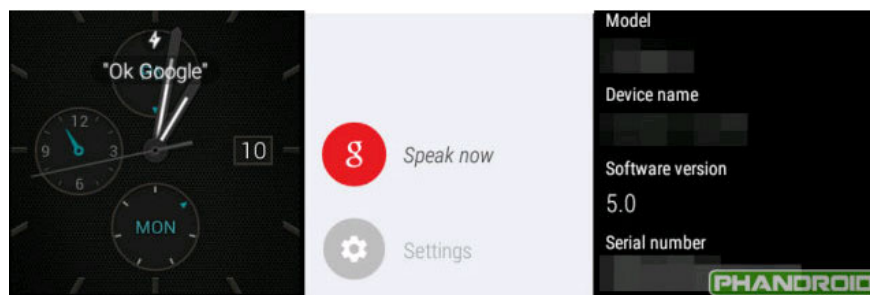

To overcome this situation, Google has updated 2 new features on Android Wear 5.0 Lollipop version as *Theater* and *Sunlight*. Two features will be activated by swiping the screen from the top down, a menu will appear and users can customize each mode such as Theater, Sunlight, Silence and Settings. With the Theater feature, the clock screen will always turn off, and only light when the user presses the hard key or tapped twice on the watch face. And Sunlight mode will help increase smartwatch's visibility in the condition of outdoor glare.

Vision feature is improved

The new **Android Wear 5.0 Lollipop** version also improves the features that make manipulating smartwatch easier. Updated features include: support for displaying large text, reversing colors or enlarging content to be viewed. These features can be started from the Settings section of the device menu.

Ok Google

The ability to launch applications on smartwatch by typing on the open screen or using the " *Ok Google* " command to boot is also improved and available on Android 5.0 Lollipop version. A menu will appear and show applications or actions that users often use when you issue voice commands, this arrangement is not really new because it was on Google Glass device before.

Can see the user interface as well as the features on Android Wear 5.0 Lollipop are Material design style and users will not have to wait long when only about 1 month is Android Wear 5.0 version is officially released .
