Samsung's latest smartphone comes with a lot of charismatic features, but this can reduce battery life. The article will guide users some tips to help extend the battery life of S3.

In theory, a smartphone will beat a regular phone in all areas except one thing, it's battery life. At the very least, there are some things you can do to improve this for Samsung Galaxy S3 and increase the time spent on your phone.

If you regularly play games, watch online videos or interact socially on this sharp, large screen phone, don't be surprised when soon, the battery status will turn to a red line.

When you have a lot of processing at once, the phone will consume battery power very quickly. So follow these simple steps to extend the battery life for the S3.

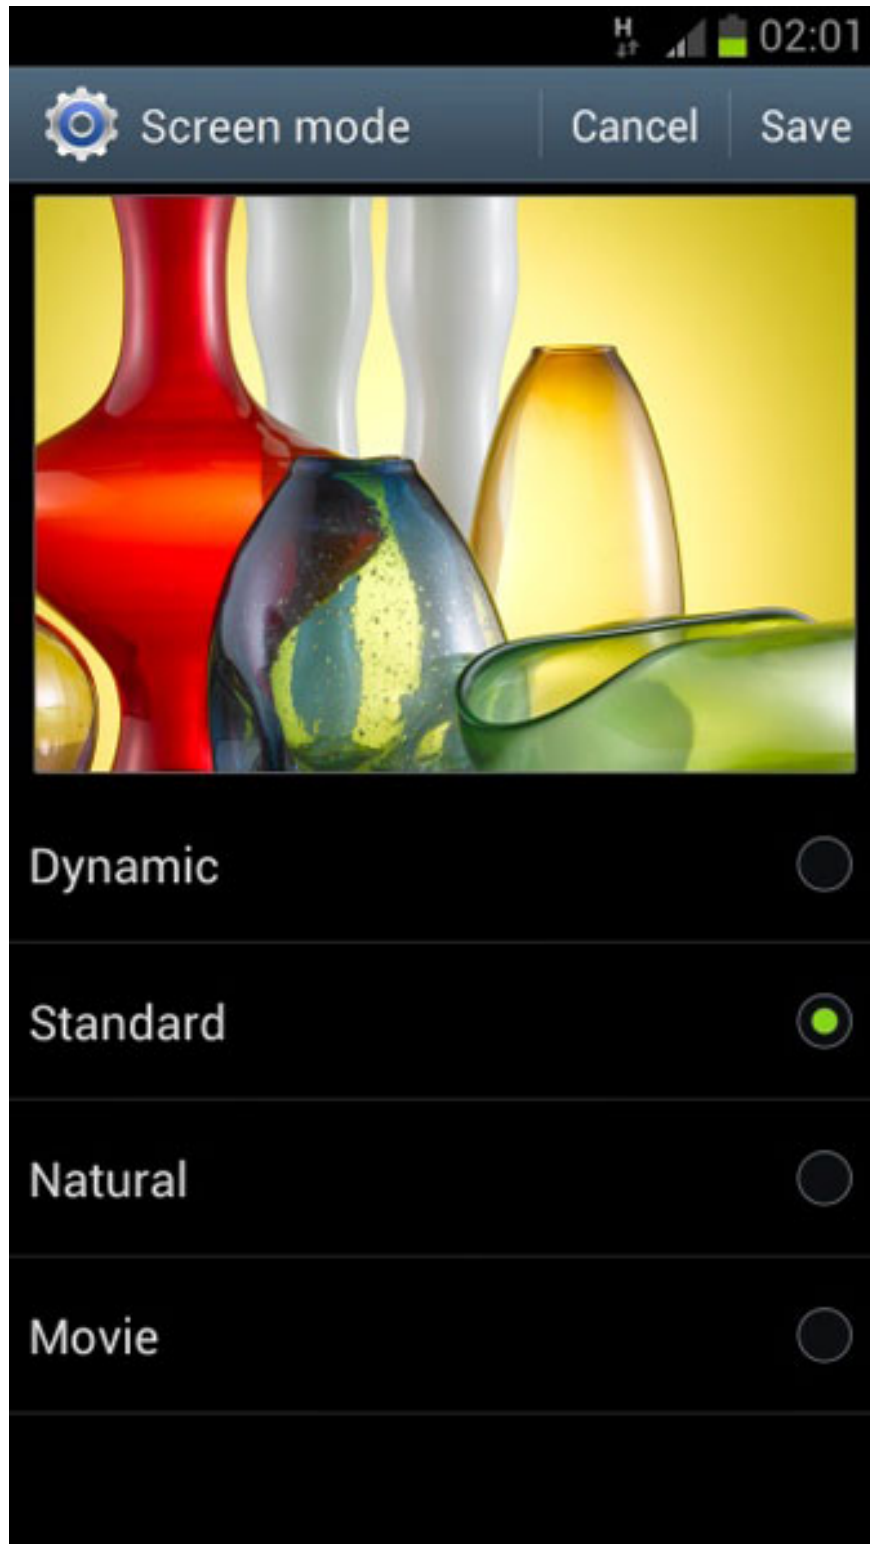

Use the 'Power saving' option

The Galaxy S3 has an integrated **Power saving** option disabled by default when we first use the phone. When activated, the program will limit the maximum speed of the CPU, reduce the power consumption of the monitor and change the background color on the system application to save battery as much as possible.

To activate the power saving option, go to **Settings** and turn on Power saving to **On** .

Replace the display color gamut

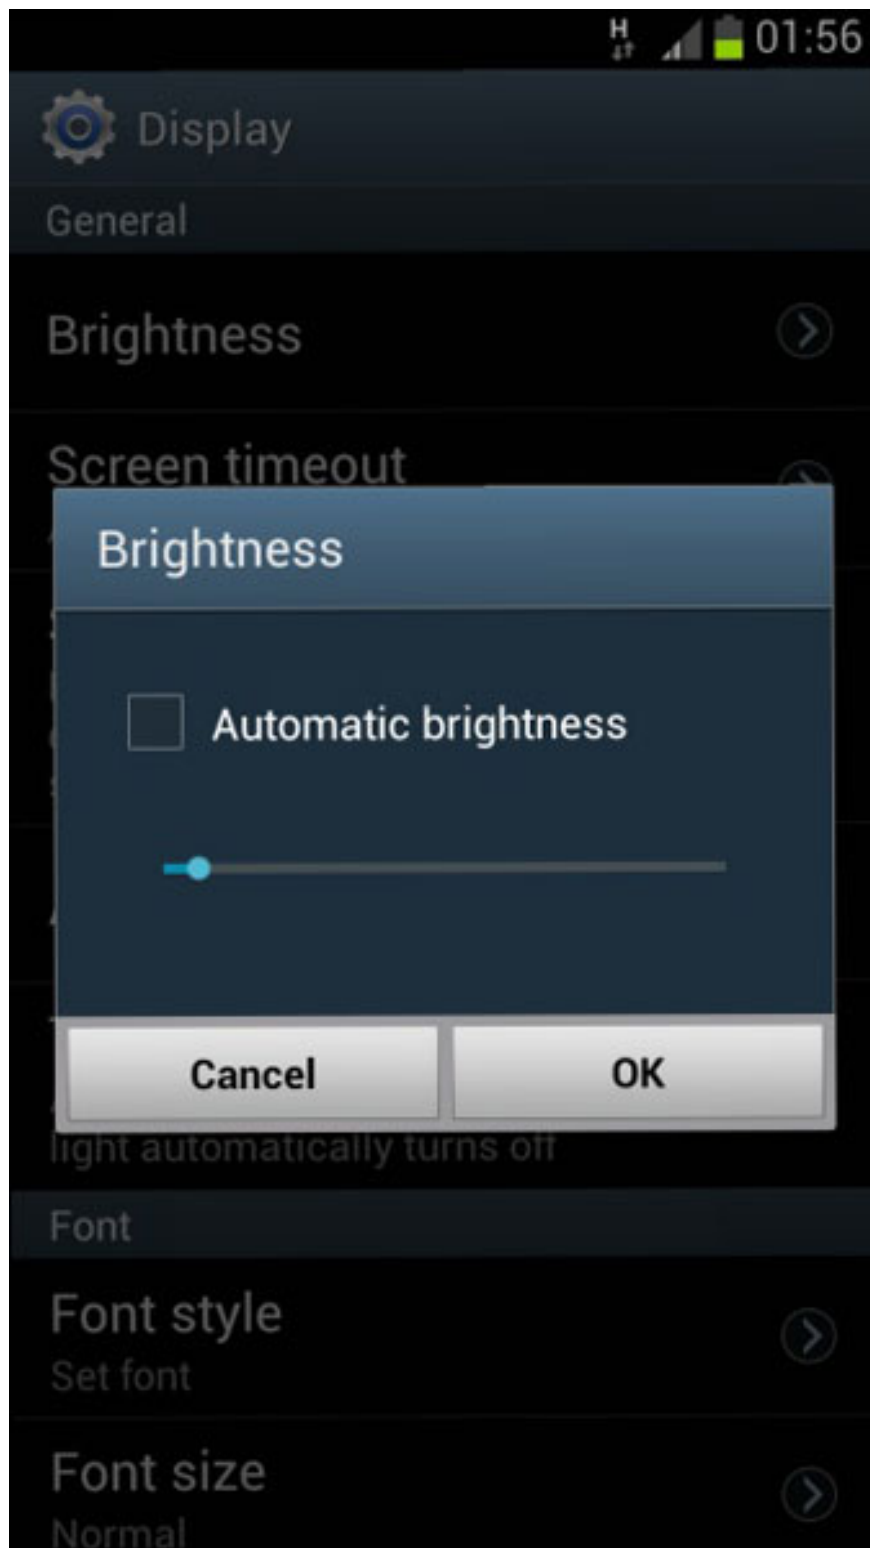

In certain displays such as AMOLED screens in Galaxy S3, some colors will consume less energy than others. For example, black will use less energy than white. So if you have a black wallpaper, the phone will save a bit more battery power.

From the screen, click **Settings> Display> Screen mode** . Here, you will be allowed to choose one of 4 different colors.

There are several intermediate applications that will bring more editing options, but may require root access. A well-known desktop application called f.lux has also appeared early on Android so try using it.

Adjust screen brightness

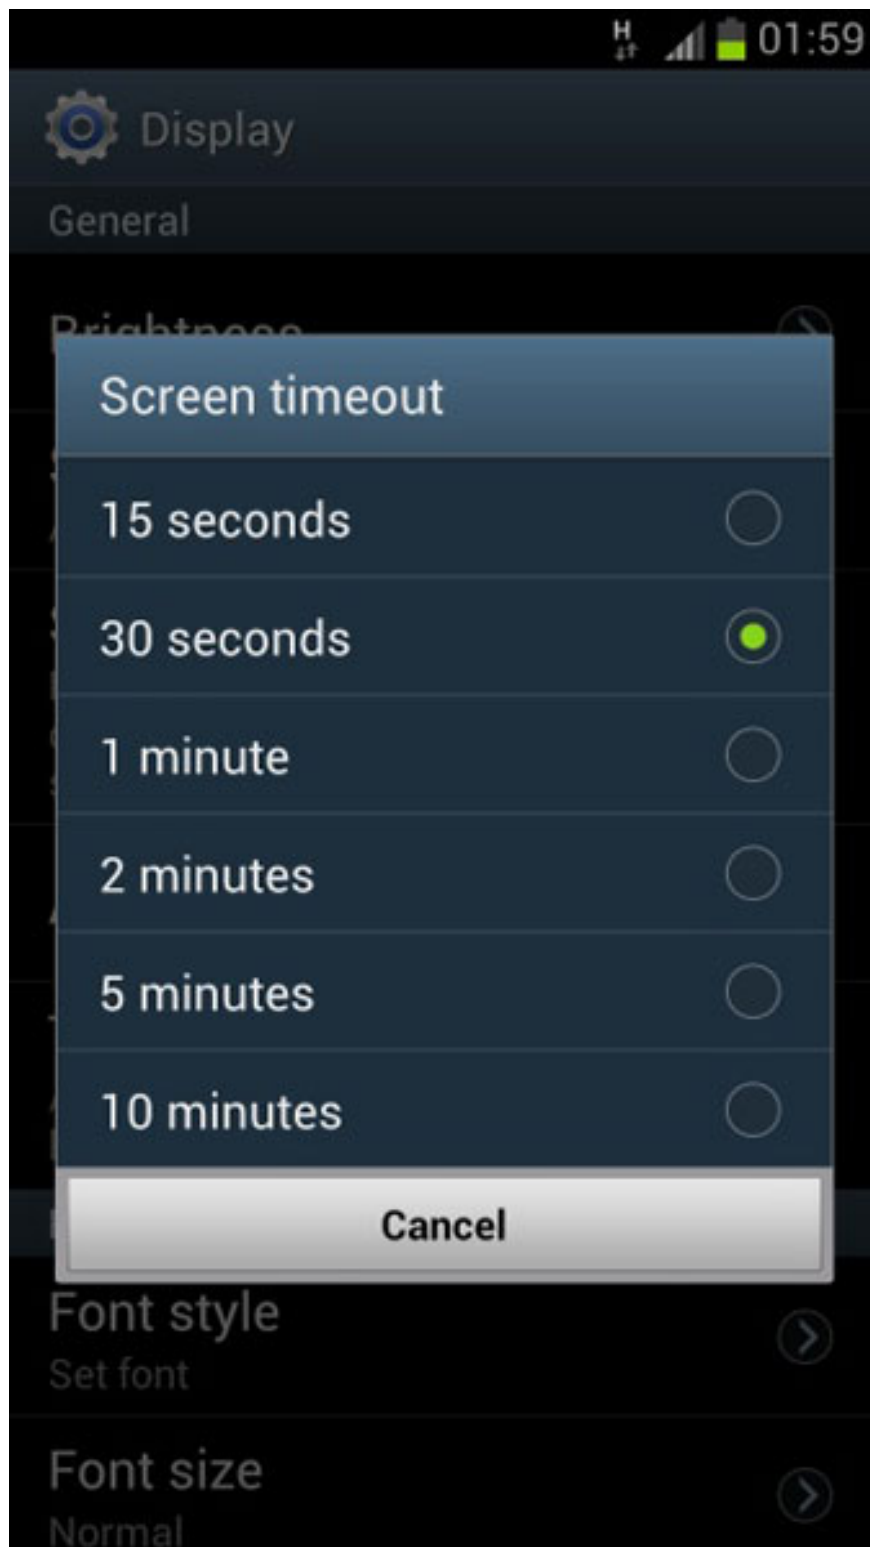

Setting the default brightness on the phone may look good, but it is the main culprit who consumes the battery if you regularly check Facebook and Twitter.

If you are indoors, you may not need to set the brightness too high. **Go to Settings > Display > Brightness** and adjust the slider to an acceptable brightness level.

The low brightness level is better for battery life, but you can use the Automatic brightness option so that the Galaxy S3 automatically adjusts brightness when you rely on ambient light.

Change setting off screen

Samsung has a lot of smart features in the Galaxy S3, such as the ability to detect whether users are looking directly at the phone and adjust the display when needed. But if this feature is turned off, users should check the screen off settings.

We can find the option to turn off the screen by going to **Settings> Display> Screen timeout** and adjusting the setting so that the screen turns itself off after not being used after a specified period of time.

Moreover, the lower standby time is better for the battery, as the device saves energy when the screen is turned off when not needed.

Disable unused radio features

When wireless services such as Wi-Fi and Bluetooth are activated, they regularly scan devices even if you don't need to use them.

Turn off these wireless services by dragging the notification bar at the top of the screen and switching status or, go to Settings and turn them off.
