Guide to plant trees in Minecraft. Farming is one of the interesting activities in Minecraft, giving you huge benefits on food. If you still do not know how to cultivate in Minecraft effectively, follow the article below

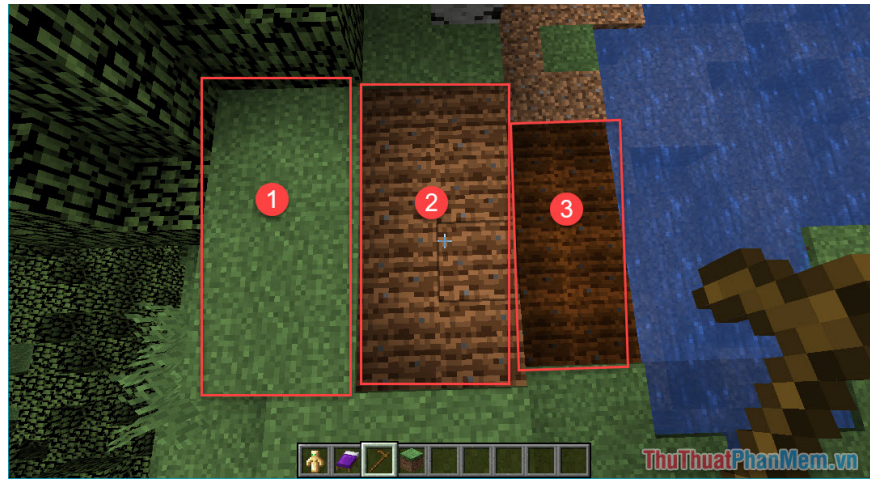

Farming is one of the interesting activities in Minecraft, giving you huge benefits on food. If you still do not know how to cultivate in Minecraft effectively, follow the article below of ThuTh ThuatPhucSoft.vn to find out now!

## Prepare the soil

Many plants require suitable soil types to grow. Soil is made using a hoe to rake the grass above the surface of the soil. If the land is left unused for a long time or is stepped on, it will become normal soil.

1. The soil has not been digged yet
2. Land after digging, can plant trees
3. The soil is near water sources, which is the best condition for growing trees

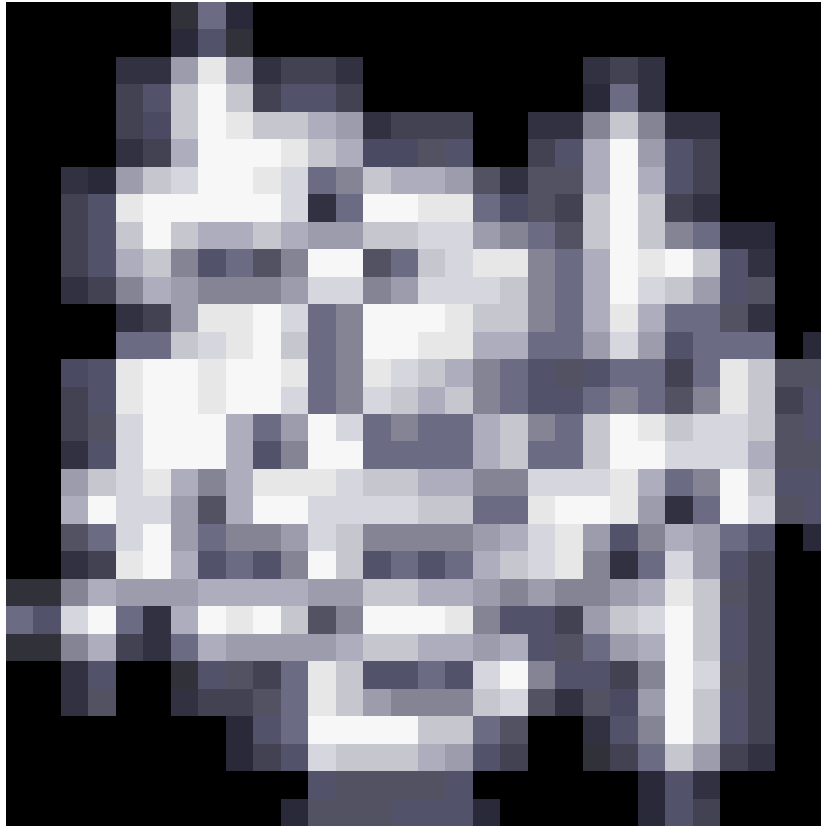

## 1. Irrigation

The soil needs to be close to water in order for the plants to grow better.

## 1. The light

Most plants need light to grow. If you plant them outdoors, they will grow during the day, if you provide more light, they will grow even more at night. Growing plants indoors or underground requires an artificial light source, otherwise the plants will not grow.

## 1. Bone meal

Many plants can be fertilized with bone meal for faster growth. Make bone meal by removing bones and manufacturing tables.

## Wheat

Rice seeds are easy to find and this is often your first crop, used to make bread. Defeating blocks of tall weeds will get rice seeds.

### 1. Start your first crop

The first thing you need to do is build a pickaxe.

Use soil near the water source to get an irrigation effect, use a hoe to scrape away the surface layer of material and you will get soil.

Sow seeds into the soil, avoiding stepping on and damaging the soil.

Place a torch next to the plants so that they continue to grow at night.

If you find bone, create bone meal and fertilize your plants to make it grow faster. If not, you will have to wait. When the yellowed wheat is as follows is ready:

When you harvest you will receive wheat (used to make cakes or feed cows and sheep) and some seeds. When there are many facilities you can build larger and more large fields.

## 1. Large rice fields

A water plot can cover 80 plots of soil.

Tip: When all the wheat is ready, you can pour water onto the surface to harvest it in bulk, then scoop it out and continue planting.

## **Melon and pumpkin**

Melon is a useful food source and can be used in drug preparation. Pumpkins are not edible as can be helmets against Enderman, or created Jack Lanterns to provide light and decoration. More specifically, Pumpkin is also the ingredient that makes Iron Giant and Snowman help protect you from Zombie.

### **1. Seeds**

Both melon seeds and pumpkin seeds can be found in the dungeon dungeons and abandoned mines. Pumpkin can sometimes grow wild on the ground and melon seeds are available from the villagers.

Melon seeds and pumpkin seeds can be made from melon and pumpkin slices.

### **1. Plant tree**

Melon and pumpkin seeds must be planted in the soil. They will then grow into melons and pumpkins, taking about 10 - 30 minutes. When fully developed, they will leave dust or grass in adjacent plots.

1. Increase the growth of plants using bone meal.
2. While seeds must be planted on soil, the fruit can appear in any soil.
3. After harvesting the fruit, the tree will continue to produce another fruit, you do not need to dig trees to replant. Each tree only produces 1 fruit at a time.
4. Use the ax to harvest melons and pumpkins faster.

### **5. Field arrangement**

There are many ways to arrange your field, and here are two suggestions:

## Carrots and potatoes

Carrots and potatoes are sometimes dropped from Zombie; Can also be found in villages.

Growing carrots and potatoes is like growing wheat, but instead of using the seed, you just need to plug it into the ground. These two types also need to be planted on the soil, it is best to have water and your job is just waiting. When you harvest, you will get more than the original.

Potatoes and carrots can be eaten raw, but baked in the oven is still better.

## Sugar beet

Beetroot is another crop that can be found in the village. When you harvest beets, you will get both beets and seeds, using the seeds to replant.

Beets can be eaten raw or processed into beetroot soup and made Rose Red dye.

## Cocoa beans

Cocoa beans can be found in dungeons, or grow on trees in the jungle. You grow them by placing them next to the log (use a tree to wear one piece and place it wherever you like. Like other trees, they will grow through many stages, and when ripe, you can be harvested.

## Nether Wart

Nether Wart can only be found in Nether, please exploit both the tree and the type of Soul beneath it (Soul Sand) because it can only be grown in this sand. Nether Wart does not need light to grow but it cannot absorb bone meal.

So, you know how to plant all kinds of plants to make food in Minecraft, have fun playing games!
