

Guide to splitting compressed file with Winrar

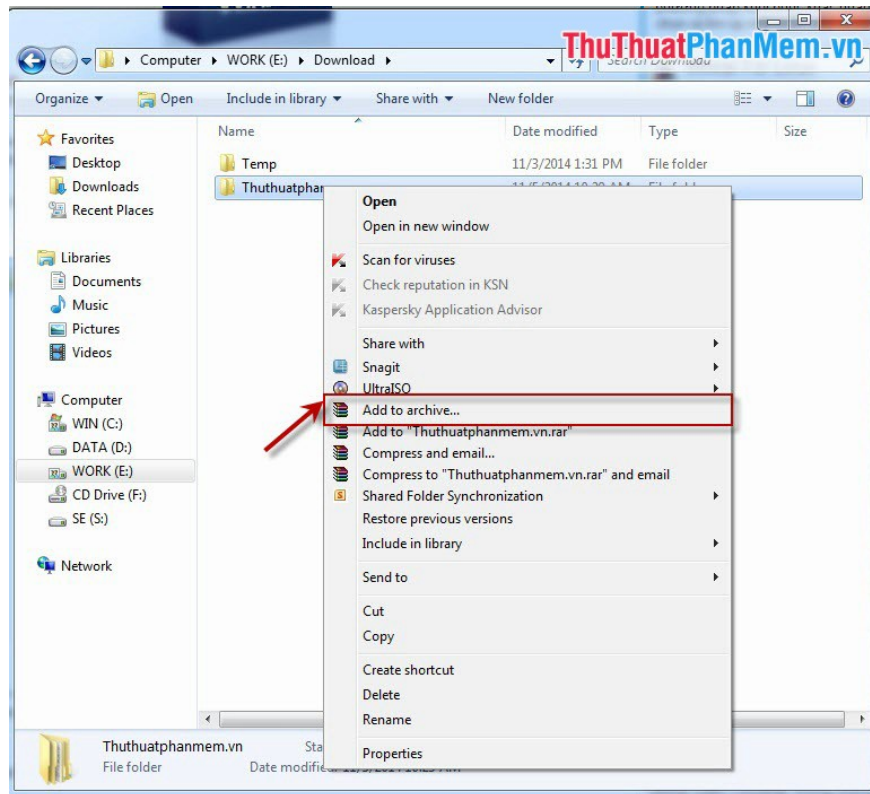

Instructions to split compressed files with Winrar - How to compress large files into several small files.

In the process of working, you often have to send data via the network, such as sending mail . To send quickly, most of us compress the files to be sent before transferring, for data that is small It's okay, but for large data files, the file after compression is quite large, you can not send because most mail boxes limit the amount of data you send. So how can you send them? The best way is that you should compress them into many small files to send multiple times.

The article shows how to split a compressed file with Winrar with just 2 simple steps:

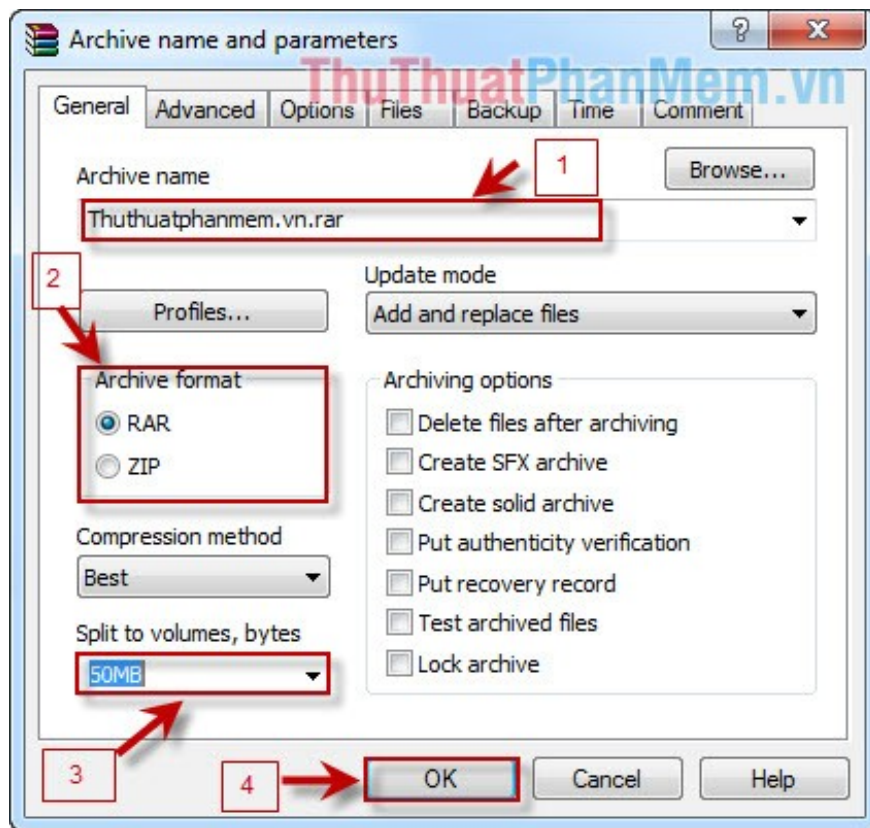

Step 1: Right-click the file you want to compress and select Add to archive

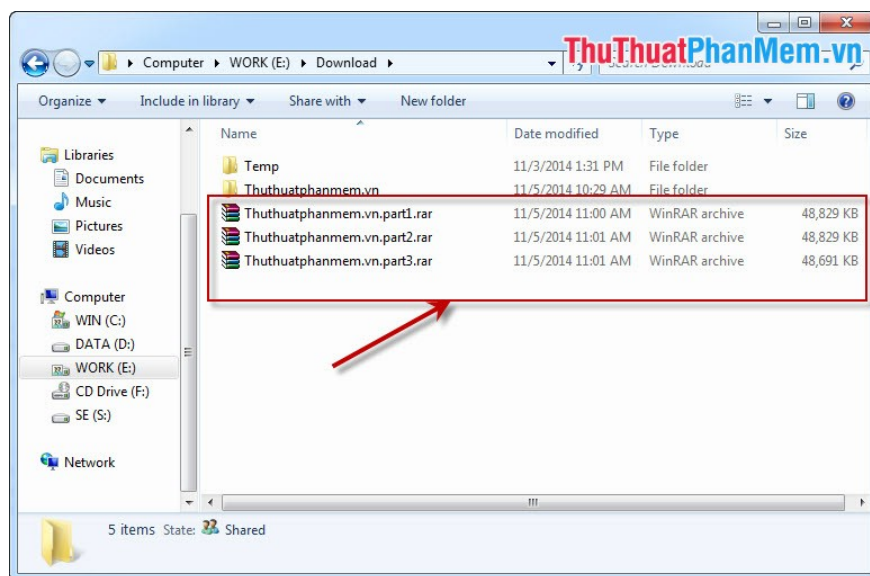

Step 2: Set parameters to split the compressed file

Archive name and parameters window appears you need to do:

- Write the name of the file to be compressed in the **Archive name**
- Select the file format to be compressed (should be RAR by default)
- Enter the size for each compressed file in the **Split to** section **volumes, bytes** (there are some common sizes available in the program)

The result is that from an original file we can split it into several files of the desired size:

On the recipient side, after receiving all the files, need to put them into the same folder and right-click on the first file (ending with .part1.rar) and select Extract to extract.
