

# Hacker successfully installs malware on your computer in less than 5 minutes

Mickey Shkatov, one of the researchers of Eclypsiium Security, demonstrated the process of breaking into the laptop by opening the bottom of the machine, directly connecting the device to the chip containing the BIOS and then proceeding to install the malware. harm only in very short time, less than five minutes.

Mickey Shkatov, one of the researchers of Eclypsiium Security, demonstrated the process of breaking into the laptop by opening the bottom of the machine, directly connecting the device to the chip containing the BIOS and then proceeding to install the malware. harm only in very short time, less than five minutes.

Shkatov said, even in some cases, hackers can conduct such attacks on computers without opening the device.

John Loucaides, Eclypsiium's vice president of engineering, said it was difficult to take precautions, even with no measures to deal with such physical attacks.

Watch the video posted by Eclypsiium below to see how easy it is for Mickey Shkatov to do the above process!

Shkatov said that before the attack he used a backdoor (free on GitHub) or a rootkit to program a dedicated device (\$ 285) to flash the computer's software or BIOS. So, in the video on Shkatov, just attach a laptop to the chip and the tool will run automatically according to the pre-programmed command.

According to Shkatov, with an experienced hacker, although he doesn't know what the target laptop is, they only need 10 to 20 minutes to find the right backdoor and deploy it after connecting the device to the laptop.
