

# Harmless effects are not expected when regular air conditioning is not maintained

Failure to maintain regular air conditioning will cause the machine to operate poorly, consume electricity, nourish pathogens affecting the health of family members.

Air conditioner is used to cool, filter dirt in the air to make people more comfortable. And like any other household appliance, air conditioning also needs maintenance and hygiene to ensure the best condition, ensuring a healthy living space for people. Unfortunately, many people still do not pay attention to periodic conditioning maintenance. Here are 2 conspicuous harms if we don't periodically maintain this device.

## **Reduce durability, power consumption**

Most people wait until the summer season when the machine is operating a lot or when the machine has trouble such as slow start-up, poor cooling, loud calling . new air conditioning maintenance. This makes repairs take more time and money because components must be replaced.

Do not clean, maintain for a long time, both the indoor unit and the outdoor unit will be dirty to prevent heat dissipation, leading to heavy power consumption, even causing overload, broken machine.

## **Nourish pathogens**

In addition to cooling, air conditioning also purifies the air, remove micro-bacteria, mold . Over time, in some parts of the machine will accumulate dirt particles, this bacteria.

If not regularly cleaned, maintained, these plaque and bacteria will interfere with the heat exchange process between the outdoor unit and the indoor unit, affecting the bactericidal ability of the air conditioner.

Even the risk of mold appearing in older models, without the proper air purification and bactericidal function, is very high. This is the cause of respiratory or allergic disease.

In order to save you repair costs and ensure fresh air, keep your family members healthy, users should maintain overall (check parts and gas quality, clean machine .) thing Mix periodically every 3-6 months.
