

Have you used the refrigerator properly when you first bought it?

After buying a new refrigerator, the majority of people use it and skip the steps to check the capacity as well as the location where the refrigerator is installed. If you check, you will know whether the machine has any component malfunction, especially for durability of the device right from the start of use.

After buying a new refrigerator, the majority of people use it and skip the steps to check the capacity as well as the installation location of the refrigerator. This will help you to check whether the machine has any broken parts when it was first purchased for a repair or exchange option, especially for the durability of the device from the start of use. In this article, we will give you read the notes to use the refrigerator when you first bought it, to ensure the durability of the machine during the long use.

1. Note when starting to use:

The refrigerator has just come back when you just bought it and you have a long journey. So now you should not use the cabinet immediately, but check the installation place and the capacity of the machine. After bringing the cabinet back, install it on a stable, stable surface and do not plug in the power for 2 hours to stabilize the gas and avoid electric shock due to power plug.

With many kinds of items and rich designs from many manufacturers, readers can refer to some types of refrigerators available at META online supermarket:

After 2 hours, plug in the power, let the cabinet operate at the smallest capacity for about 8 hours and do not put any food in the cabinet. This will help the cabinet to get used to the working mode, to avoid causing damage due

to sudden pressure. Moreover, if you put food in early, the food will be haunted by the plastic smell of the new refrigerator.

In the process of unloading the cabinet (no food), every 2 hours you should open the cabinet for about 5 minutes to get the smell of cold plastic to escape, make sure the inside of the cabinet will be clean and clean. After 8 hours, you can clean the inside of the cabinet and put the food in normal storage.

2. Notes during the operation of the cabinet:

Some users often assume that the cabinet is faulty when the refrigerator has been operating for several hours and still not feel cold. Don't worry too much about this. Since it is a new refrigerator, it will take a while to stabilize, after 8 hours the machine runs idle (without food), it will work normally.

The freezing time for 1-2 trays, ice cubes is from 2 to 4 hours.

For stone cans it will take more time. Specifically, if you make 5 cans of ice, you have to stay overnight for 8 to 10 hours to harden.

Do not put the food too cramped inside the cabinet, because the cold is hard to find now to circulate inside the cabinet, resulting in poor cooling and the user mistook the refrigerator for failure.

These are useful tips to help you use a durable refrigerator for a long time, by checking and operating the machine properly when you first buy it. Please save this article and refer to use it properly with the new refrigerator to buy.
