

Homemade 15-year-old AirPods for use for only 4 USD

Recently, a user named Sam Cashbook (15 years old) posted a DIY product, a pair of very unique homemade 'AirPods' on Reddit.

AirPods is one of the most popular pair of wireless headphones on the market today. However, to own it, users will have to pay a small amount, its starting price is 160USD. But this Apple product has a low durability, many users have responded to the product's battery failure after only one and a half years of use.

Recently, a user named Sam Cashbook (15 years old) posted his DIY product, a unique pair of homemade 'AirPods' on Reddit.

Sam Cashbook added, he came up with the idea of making a pair of wireless headphones at home when his friend received a birthday present as a pair of AirPods. It's too expensive for Sam. He started this project two months ago.

Sam took the electronic components in a pair of bone-transmitted wireless headphones that he bought for quite a cheap price. After that, he cut the wire connected to the diaphragm of the pair of old headphones and welded them to the strings of a pair of EarPods. Sam also uses a larger size battery to replace the built-in battery.

So he had a pair of "AirPods", of course his homemade version was uglier than the AirPods bought from the label. Sam's "AirPods" pair works well from playing music, stopping music, adjusting volume, to charging.

Sam's project costs only \$ 4.
