

How Cortana on Windows 10 works

Slower than Apple Siri and Google Now, but Cortana will surely be a heavyweight competitor in the currently bustling virtual assistant market. The presence of a virtual assistant from Microsoft will be one of the most notable points about Windows 10.

Slower than Apple Siri and Google Now, but Cortana will surely be a heavyweight competitor in the currently bustling virtual assistant market. The presence of a virtual assistant from Microsoft will be one of the most notable points about Windows 10.

After debuting in the US this year, Cortana is starting to expand its coverage worldwide. With a series of "*vortex kicks*", Microsoft is clearly planning Cortana to become Siri's serious rival.

However, Microsoft's investment level for Cortana shows that *digital assistants* are becoming an important part of the operating system battle. From the perspective of big guys and fans, it seems that Siri, Google Now and Cortana are becoming "*embodied*" for the world's No. 1 operating systems today.

In recent times, Microsoft has also brought Cortana to beta test version of Windows 10. Currently, the virtual Windows assistant has not really had a nice interface, but the features of Cortana on the desktop are also quite good. complete. Like competitors on iOS and Android, Cortana can perform basic features such as reading calendars, scheduling appointments, calling a specific contact from your contacts . These features are quite familiar. on the smartphone, but obviously the virtual assistant experience on the laptop / desktop will help reduce your dependence on the phone and create a more unified experience.

Since the current number of Windows Phone users is still quite low, the Cortana experience on Windows desktop will significantly increase the reputation of this virtual assistant. Not only is it a software, Siri can become as important as the standalone platform of Windows - this will be the way of homogeneous communication of users with Lumia machines, Windows laptops and tablets. Both Apple and Google are going in the same direction: Google has brought Google Now to Chrome, while Siri has also stepped into Mac OS X.
