How to adjust the iron temperature is suitable for each type of fabric

There are two main types of iron: dry iron - heat or steam iron. These two types are almost equipped with a temperature control knob in the middle of the product body and are divided into three heat levels, suitable for each fabric. The table below summarizes the common types of fabric, the appropriate heat levels and the corresponding iron usage.

Material Heat level Suitable ironing method Synthetic fabrics (acrylic, viscose, polyamide, polyester), silk, glossy fabrics

Heat rating: •

(

Is dry on the reverse side of Wool fabric

Heat rating: ••

(from 110 to

Light steam on the left side of the fabric or ironing through a layer of fabric placed on top. Cotton fabrics, cotton fabrics

Heat rating: •••

(from 150 to

Iron dry when clothes are still damp, or steam when fabric is dry. Linen Heat level: ••• to MAX Dry ironing while clothes are still damp, or steam when fabric is dry. Denim (Jean) Heat level: ••• to MAX Recommended use is maximum steam

Note :

1. Particularly for velvet and cashmere fabrics (yarns made from the body and lower abdomen of Cashmere goats), this is not ironing clothes made of these two fabrics.
2. If you do not know what kind of fabric your clothes can track on the label, the stamp is sewn inside.
3. If it is continuous fabric, you should choose ironing at low temperature first.
4. In case your iron is a dry - heat iron that the fabric requires is moisture, you can spray / spray more water to moisten the cloth before proceeding the process is flat.

Tips for using the iron to save electricity

1. Should choose the maximum power type of about 1800W to 2000W is sufficient.
2. Avoid using during rush hour when using too much electrical equipment to avoid being overloaded.
3. For some types of clothes made of cloth that can withstand low temperatures, after a period of electricity use, you can unplug and take advantage of the heat still on the iron side of the iron to continue.
4. Using in an air-conditioned room or in front of a fan will also cause some heat from the iron to be partially lost, resulting in electricity consumption as usual but reduced operational efficiency.
5. Use foil and aluminum foil for ironing because they have the ability to charge. Lining down under clothes that need to be flat and then ironing, doing so will save up to 50% of the heat energy consumed.

Iron - What kind of ironing iron is good now?

Dry iron - Heat iron
