

How to browse the web directly from within Thunderbird

In this tutorial we will show you how to set up and use a very interesting add-on of Thunderbird, ThunderBrowse, this add-on will allow you to browse the web directly ...

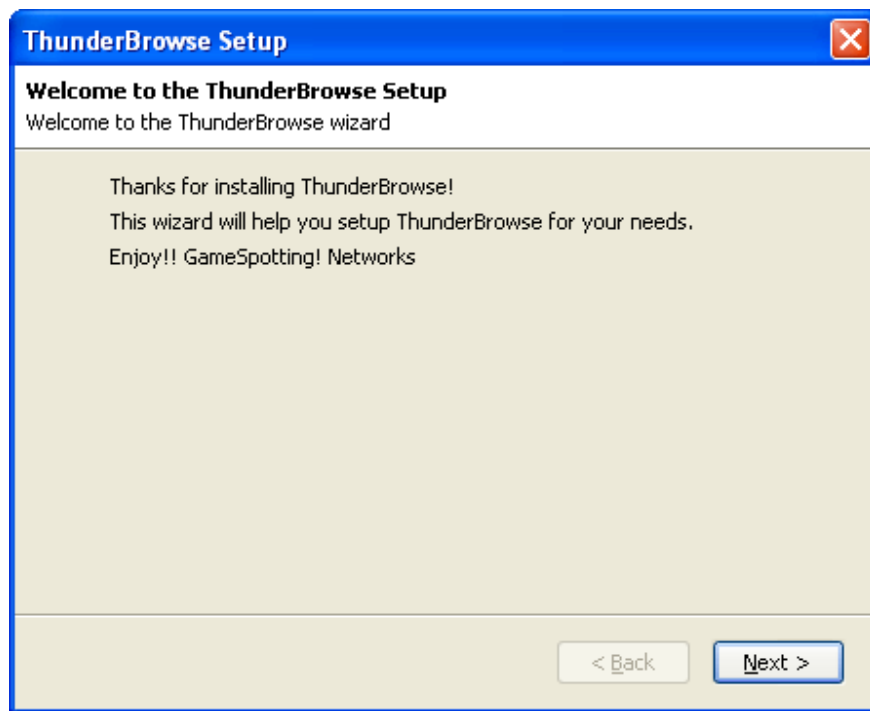

Ross McKillop

In this tutorial, we will show you how to set up and use a very interesting add-on of Thunderbird, ThunderBrowse, which will allow you to view web pages directly from the word. in Thunderbird without having to open the web browser.

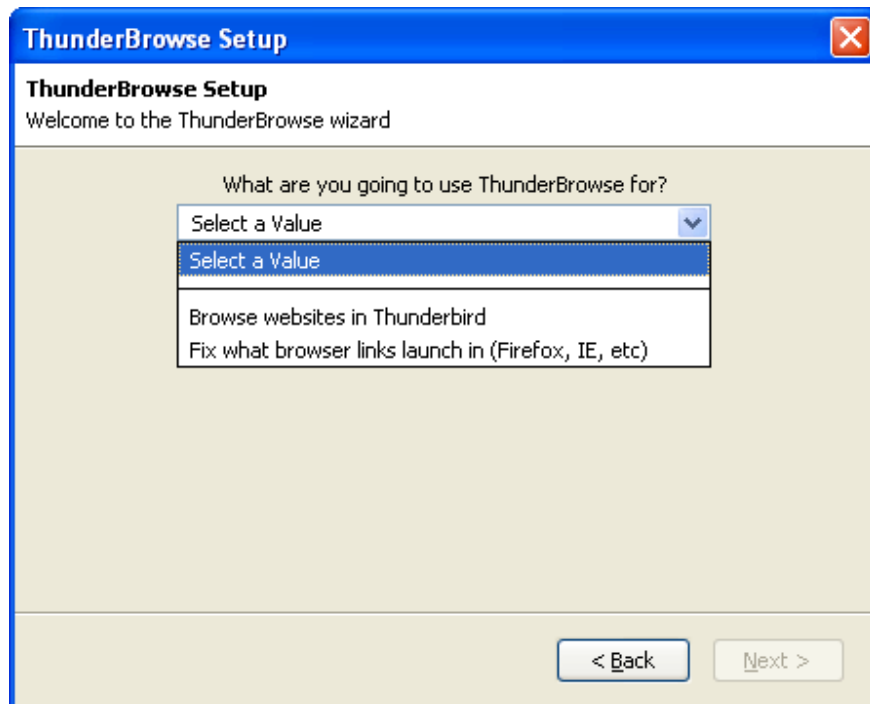

1. Start by downloading ThunderBrowse. Install it similar to what you do with Thunderbird add-ons - save the file to the hard disk, from Thunderbird, open the add-ons from the Tools menu, click the Install button. Find the ThunderBrowse file you downloaded, select the file and click OK.
2. Once installed, a window will appear with information about recent changes to ThunderBrowse. Please close that window.

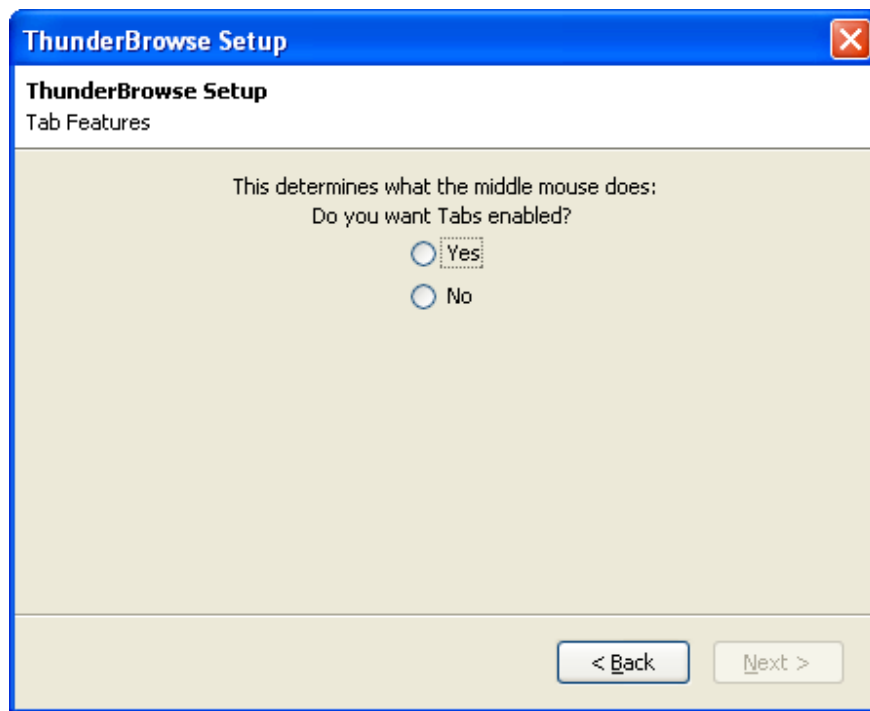

3. Click Next on the initial setup window.

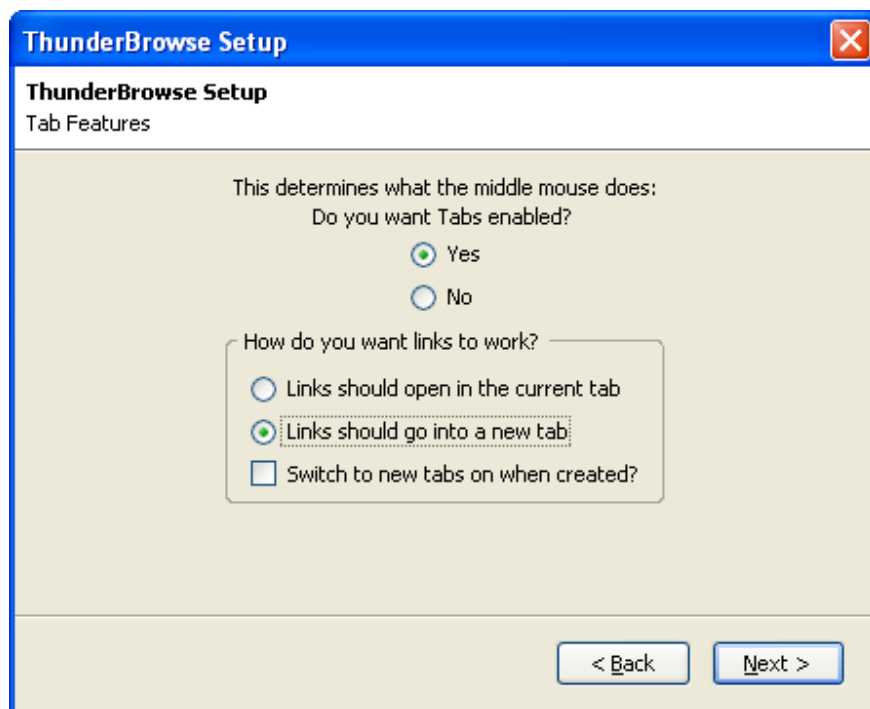

4. Click on the **Select a value** menu. Since you *may* not want Thunderbird to replace your main browser, please choose **Fix what browser links in** then click **Next** .

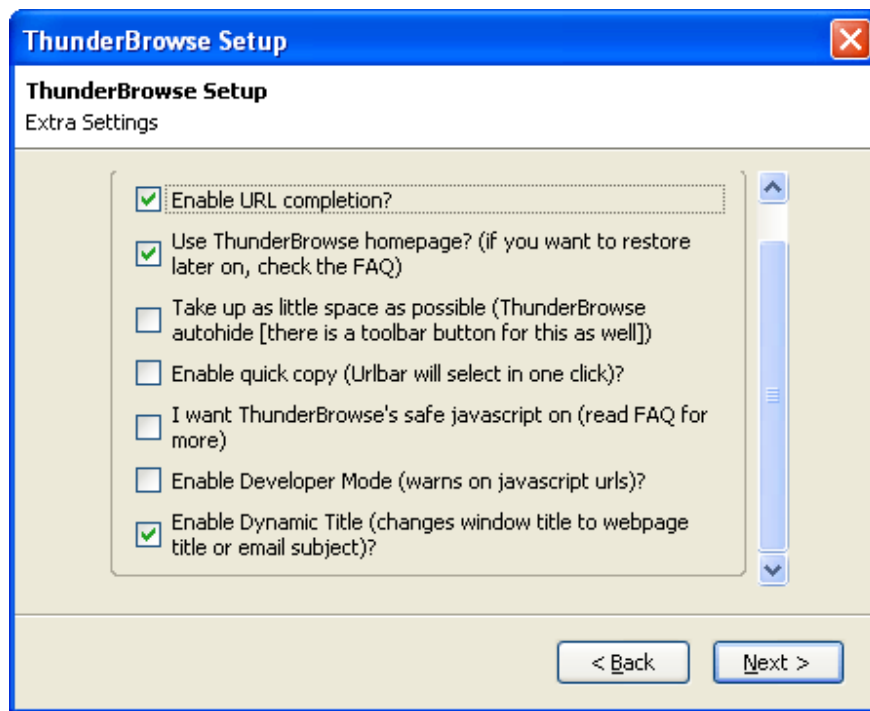

5. When asked if you want to enable Tabs, select Yes.

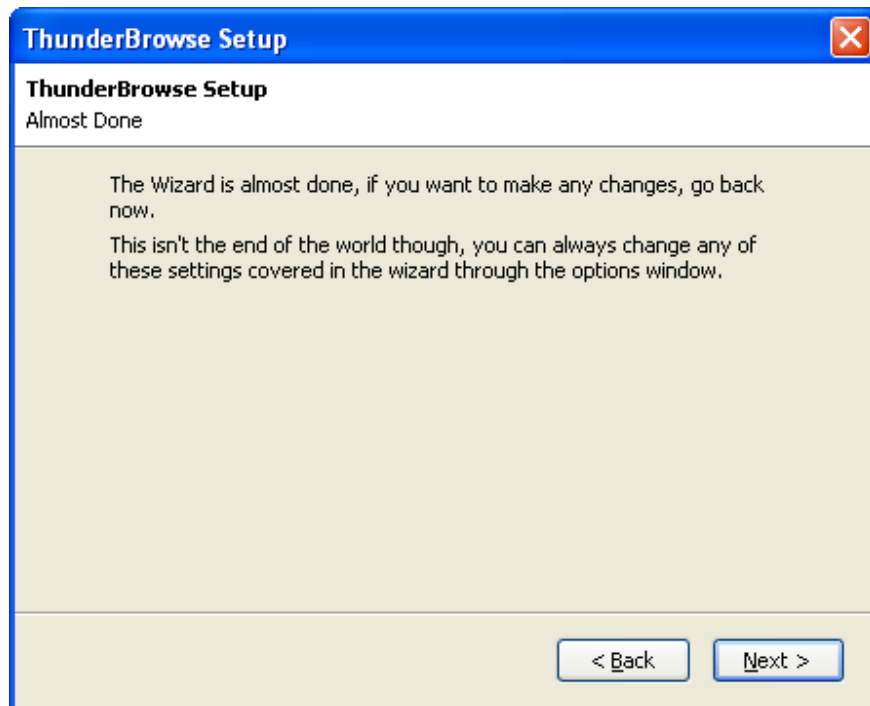

6. Now decide how you want the tabs to function. We have selected the **Links should go into a new tab**, but you should choose which tab is best for you. The selection of dogs can be changed later. At this point, click Next to continue.

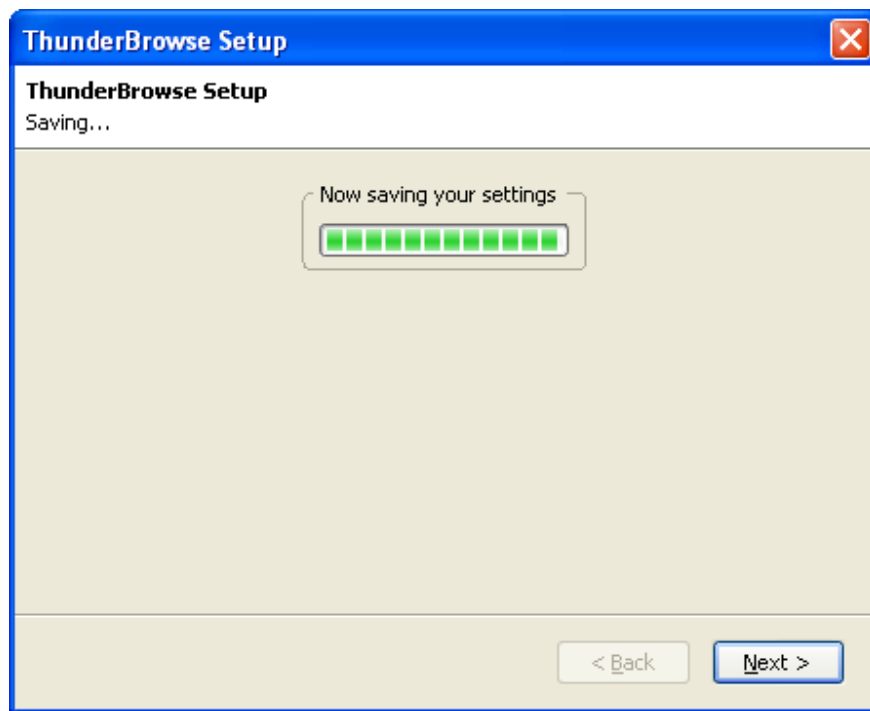

7. From here you will be able to enable or disable the feature set. We have left the default as they are, but you should choose what works best for your job. Don't stop here, and continue to click Next.

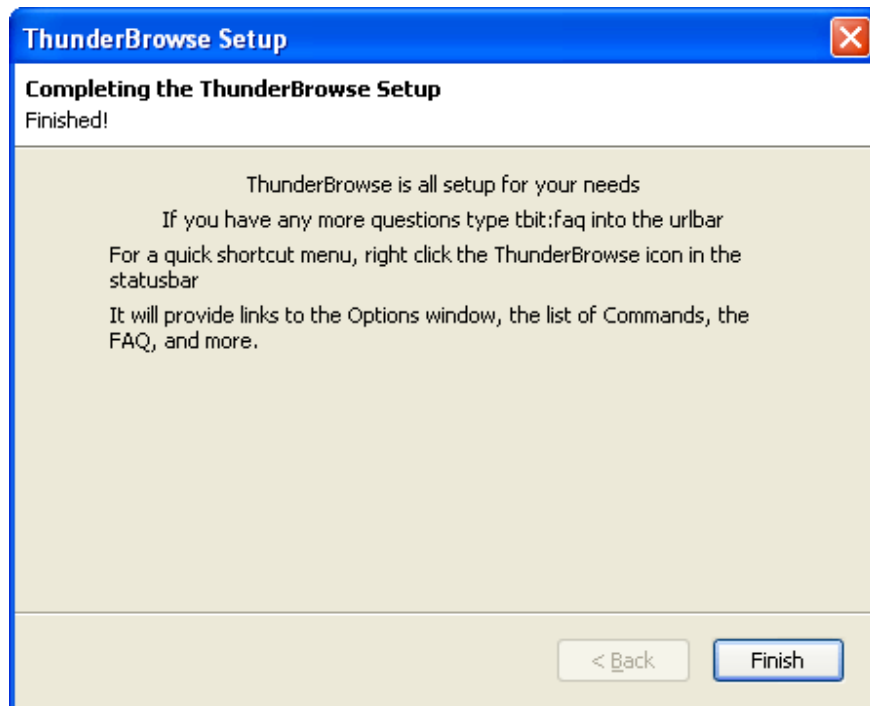

8. Continue clicking Next.

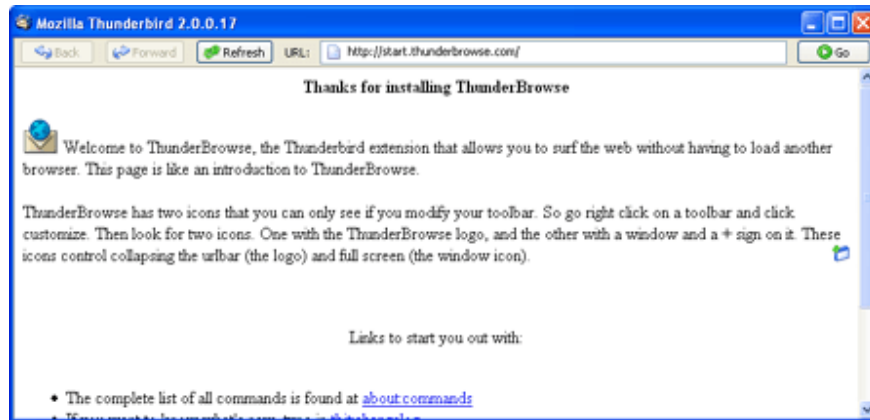

9. Once your settings are saved, click Next in the last time you modified it.

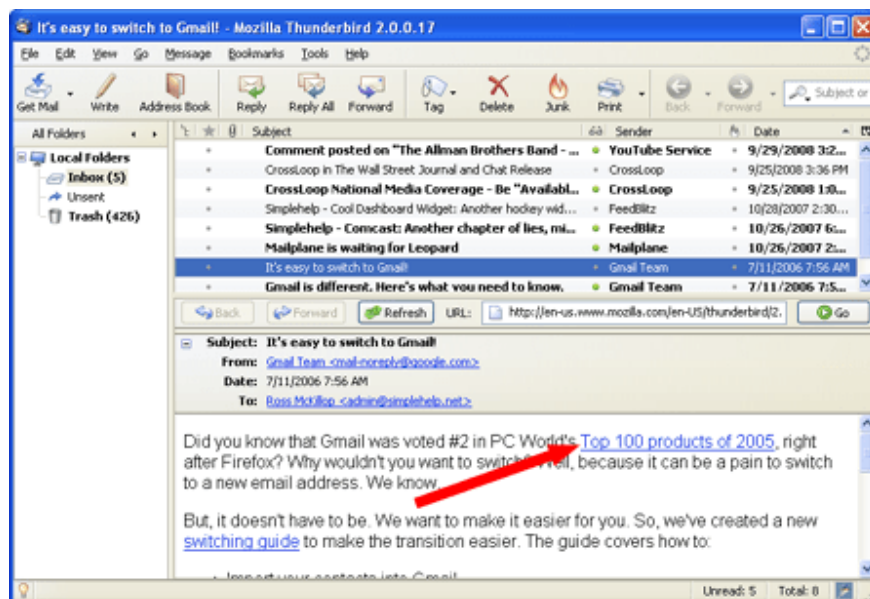

10. Click Finish.

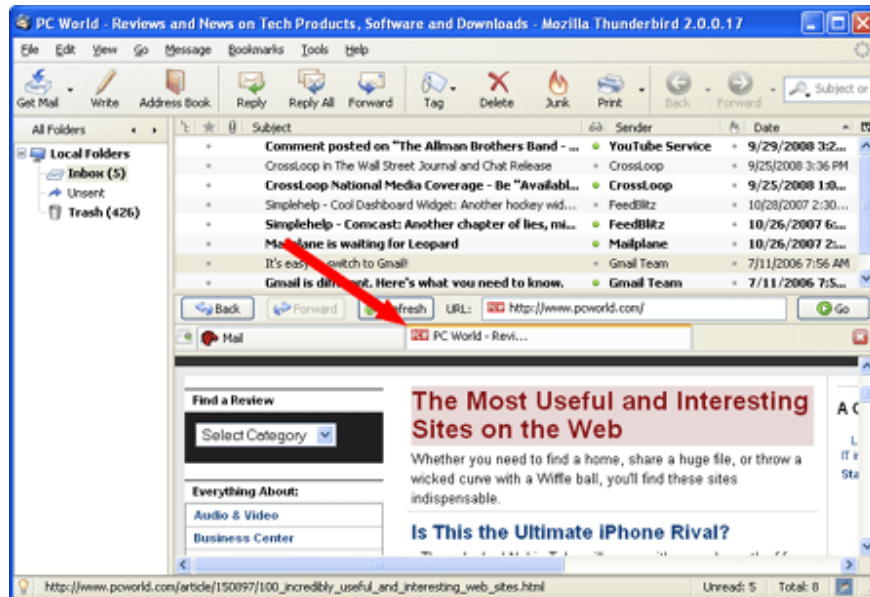

11. Next a dashboard will appear. Allows you to review all the information on that page, then close this page.

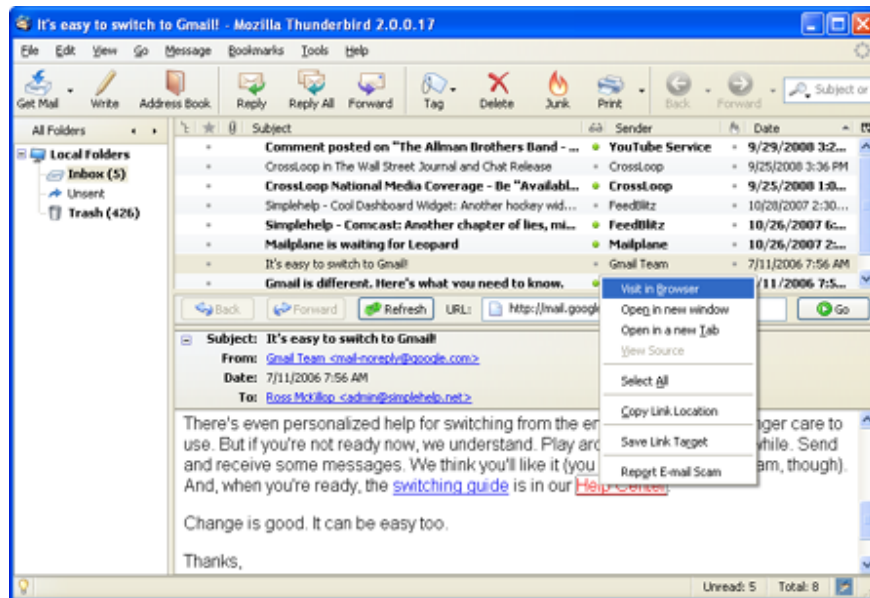

12. Find an email with a link in it and click on the link in the content of the email.

13. Then instead of launching your browser, Thunderbird will open a new tab and a page with the link you just clicked will load in that tab. Click on this tab (unless you've selected multiple links that open automatically and focus on that tab) to see the content of the page.

14. If there is a link in the email you want to open in your browser instead of a tab in Thunderbird, right-click the link and select **Visit in Browser** . This link will open your default web browser.

15. That's all the work you need to do. We hope this guide will help you save considerable time!
