

The most detailed guide on how to change your location on your phone.

Are you thinking about changing your virtual location to prank your friends or for some other reason? Technology has made everything possible, and faking your virtual location is no exception.

Thinking about changing your virtual location to prank your friends or for some other reason? Technology has made everything possible, and faking your virtual location is no exception. So, if you're looking for the best ways to change your location, this detailed guide from TipsMake.com will help you understand all the details and also introduce the best tools to help you accomplish the task.

Part 1: Basic information about virtual locations

What is a virtual location?

The current location of your device is called its virtual location or GPS location. Apps on your device use this location to track where you are.

When should you change your virtual location?

There are several situations that create the need to change virtual locations. For example:

1. Many people want to spoof their location on their phones when playing games like Pokémon GO and many other location-based games. Spoofing your device to a different location allows you to continue playing even if you haven't actually moved.
2. Many people want to set a fake location on dating apps to explore options different from their actual location.
3. If you want to 'appear' at certain upscale restaurants or other famous locations on social media, you'll need to change your virtual location.
4. In many situations, you may not want your boss, colleagues, and others to know your current location, and thus the need for a virtual location change arises.

Besides these, there may be some other interesting reasons why you might want to change your current location.

Part 2: How to change your virtual location

Changing your virtual location might sound like a difficult and complicated task, but there are several tools and programs available that can help you get the job done quickly. This article lists some popular and reliable software in the category below.

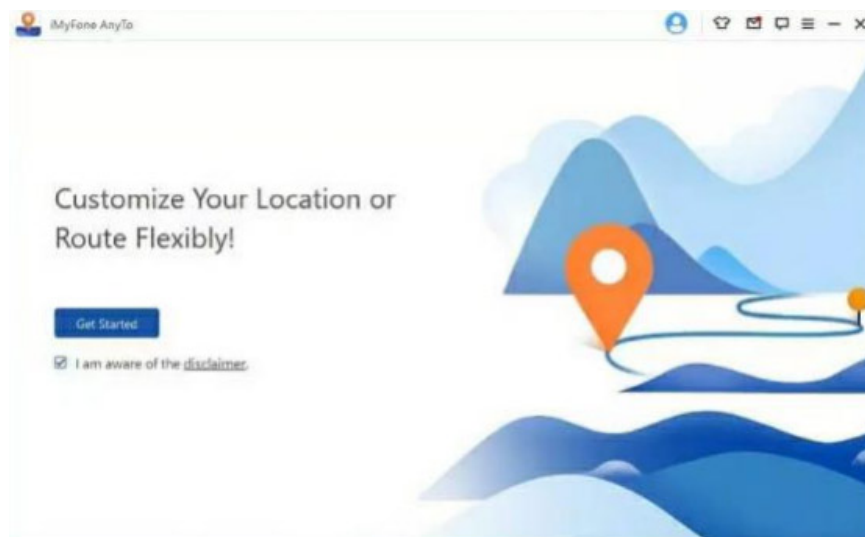

1. iMyFone AnyTo GPS Spoofer

Download iMyFone AnyTo GPS Spoofer

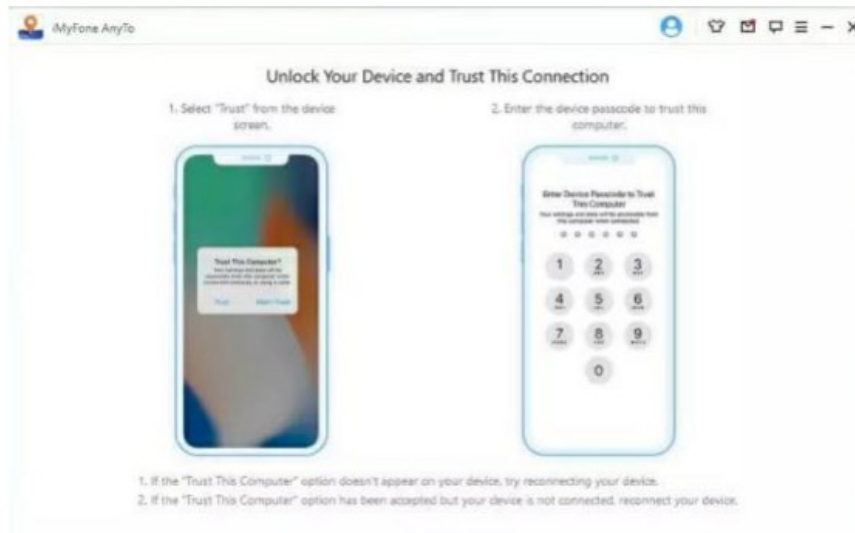

This is one of the best tools that can be used to change location on Android, as well as iOS devices. The software is available for Windows as well as Mac systems and allows you to change your GPS location to anywhere in the world. Using the software, you can even create a route on the map and adjust your movement speed by moving along that map. To enhance the gaming experience, this tool allows you to spoof your location using the joystick. Additional features include support for multiple devices simultaneously, the option to import and export GPX files, save historical logs, set coordinates, etc.

Steps to change your virtual location using iMyFone AnyTo GPS Spoofer

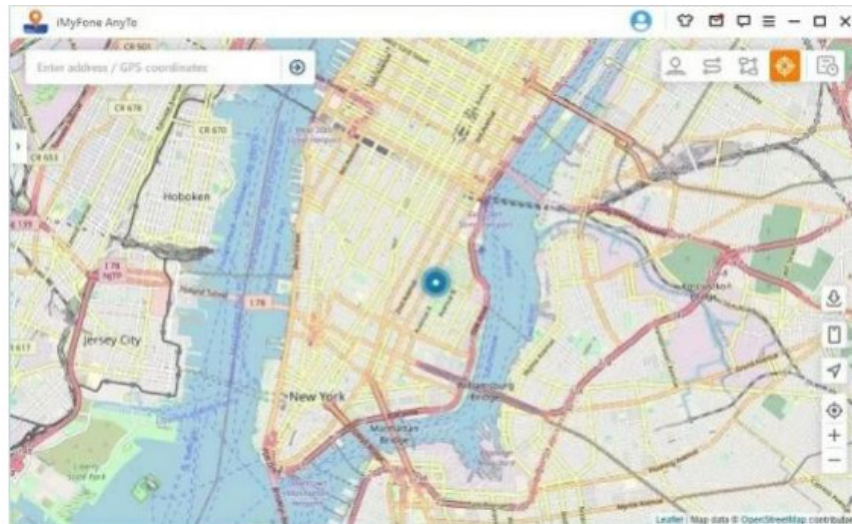

Step 1. Download, install, and run the software on your system. Then, from the main interface of the software, click on the **Get Started** option .

Step 2. Using a USB cable, connect your Android or iOS device to the system. (For iOS devices, you need to enable the "**Trust for the system**" feature , while on Android devices, you need to allow USB debugging).

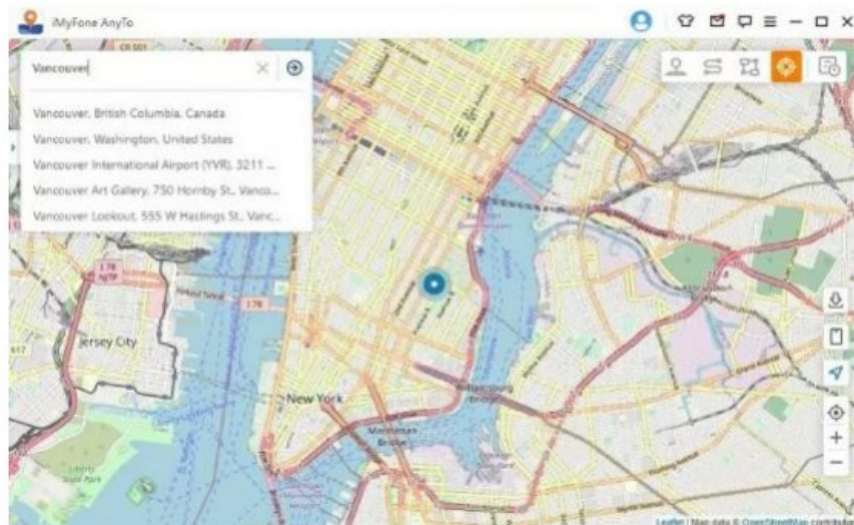

Step 3. Once the device is connected, the map will load from there, allowing you to find your desired location.

Note : There are different modes for setting the position, such as Teleport mode, two-point mode, multi-point mode, etc. The steps below are for Teleport mode.

Step 4. In the upper right corner, tap **Teleport Mode** and then select your destination by zooming in and out of the map. You can also add GPS coordinates or an address.

Step 5. After selecting the destination, you will see a sidebar displaying all the information about the selected destination. Click the **Move** button , and the device's location will be set to the selected destination.

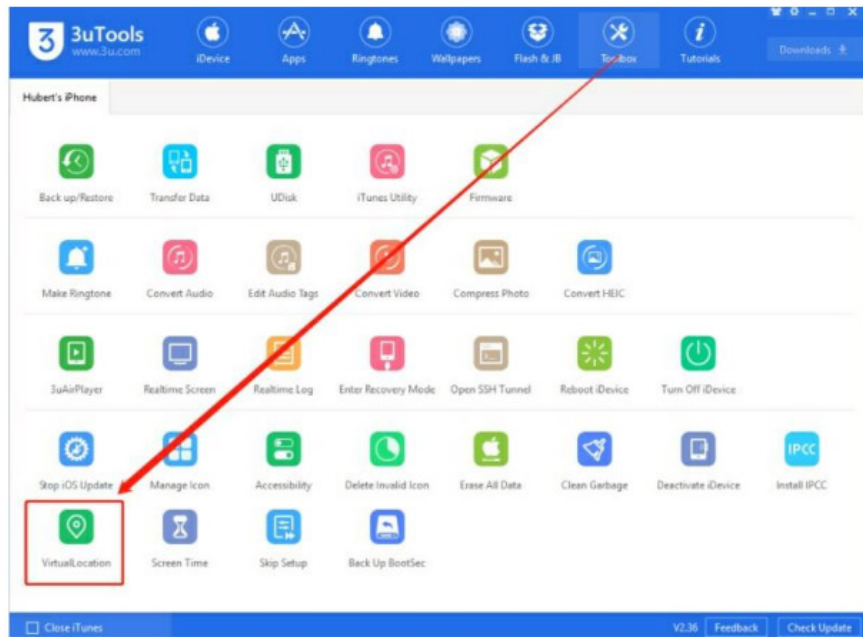

Note : To return to your original location, simply restart your device.

2. 3uTools Virtual Location

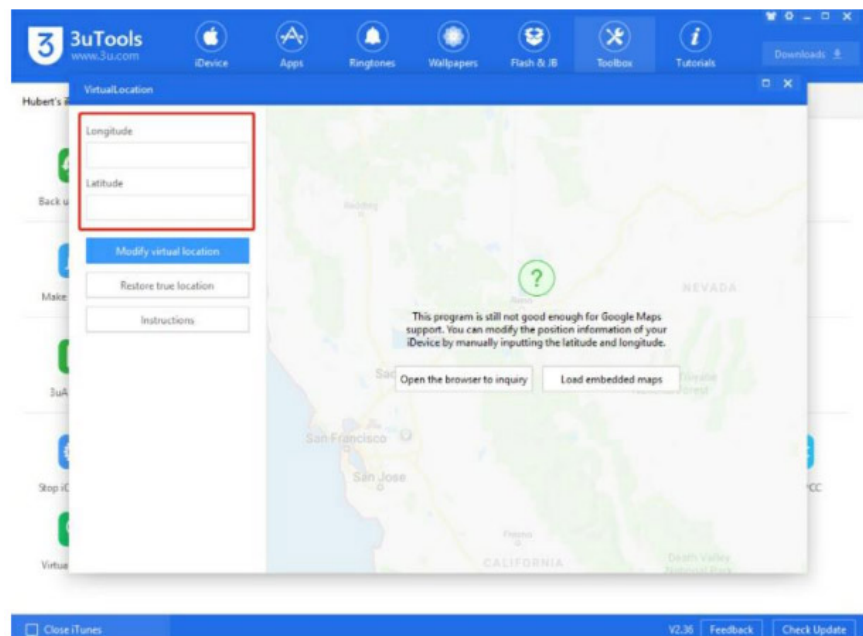

3uTools is a feature-rich software for iOS devices that performs a range of functions such as data management, location changes, data backup, video conversion, and more. Using the software's Virtual Location feature, you can easily change your iOS device's location in a few simple steps. Restrictions on specific game-related regions can also be bypassed using this function.

Steps to change virtual location using 3uTools

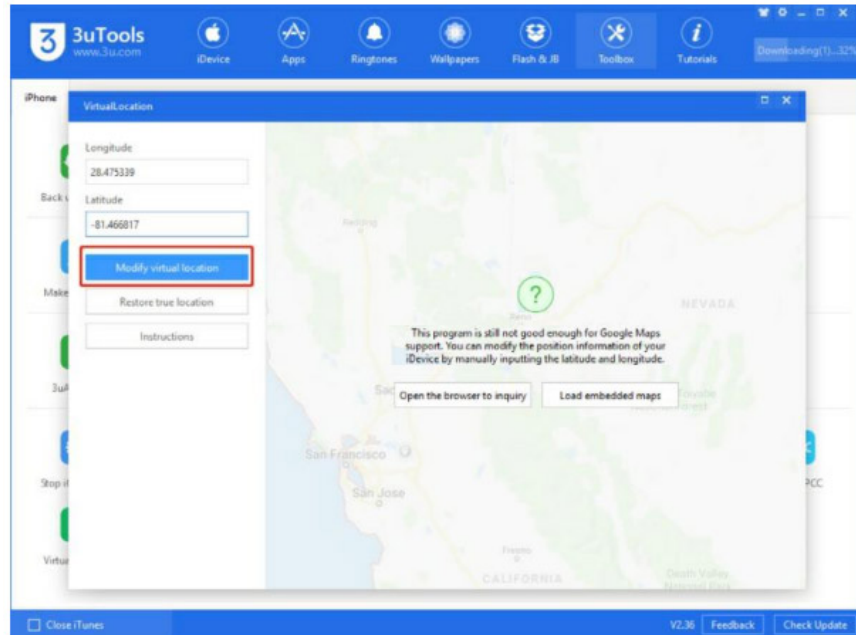

Step 1. Launch the software installed on your system and then connect your iOS device to the system using a USB cable. Once the device is successfully connected, select **Toolbox > Virtual Location** .

Step 2. Next, enter the latitude and longitude of the destination you want to set as the displayed location.

Step 3. Click on the **Modify virtual location** option . After the location is set, you will receive a similar prompt.

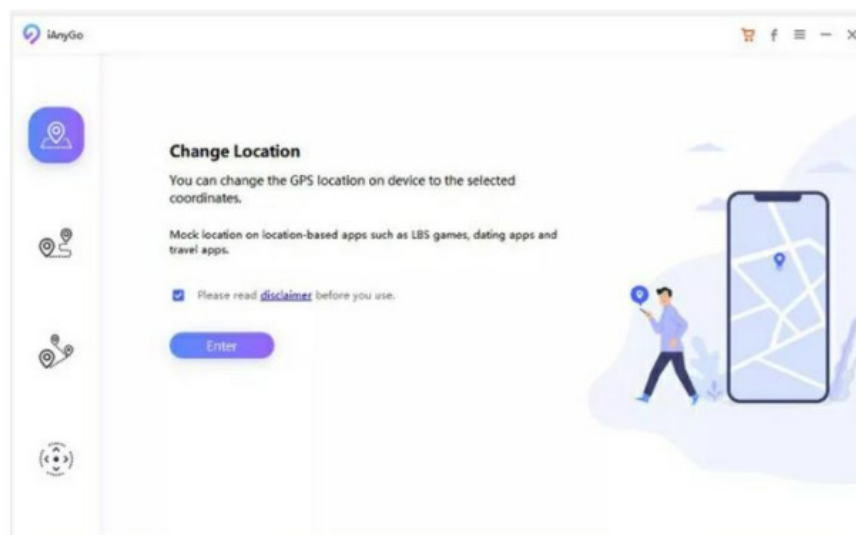

Note : Make sure your device screen is always unlocked throughout this process. To return to the true location, select the "**Restore true location**" option and then restart the device. Restarting the device directly will also reset it to its original location.

3. Tenorshare iToolab iAnyGo

This Windows and Mac-based tool allows you to change and fake your location on your iOS device. The process is quick, and your location can be changed in just a few clicks. The software works for all location-based apps like WhatsApp , Pokemon Go, Facebook , etc. You can set your desired location via the map or add a GPX file for your desired route. Adjustable controls are also supported for easy navigation. GPS motion tracking at customizable speeds can also be set.

Steps to change your virtual location using Tenorshare iAnyGo

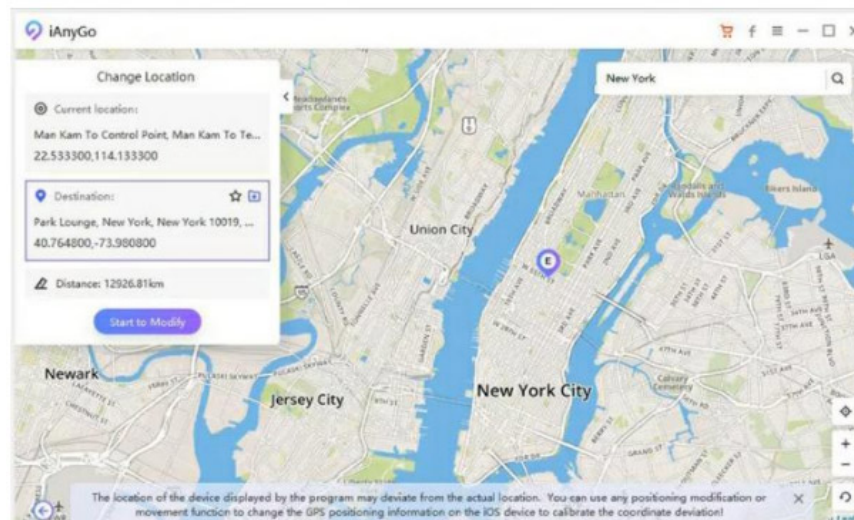

Step 1. Open the software installed on your system and select **Change Location** as the default setting.

Step 2. Using a USB cable, connect your iPhone to the system, unlock the device, and press the Enter button to begin. Click the **Trust** option on your iPhone.

Step 3. Next, in the search box, enter the desired destination address or GPS coordinates. Click **Start** to modify after the location is selected. Your device's location will be set to the newly selected location.

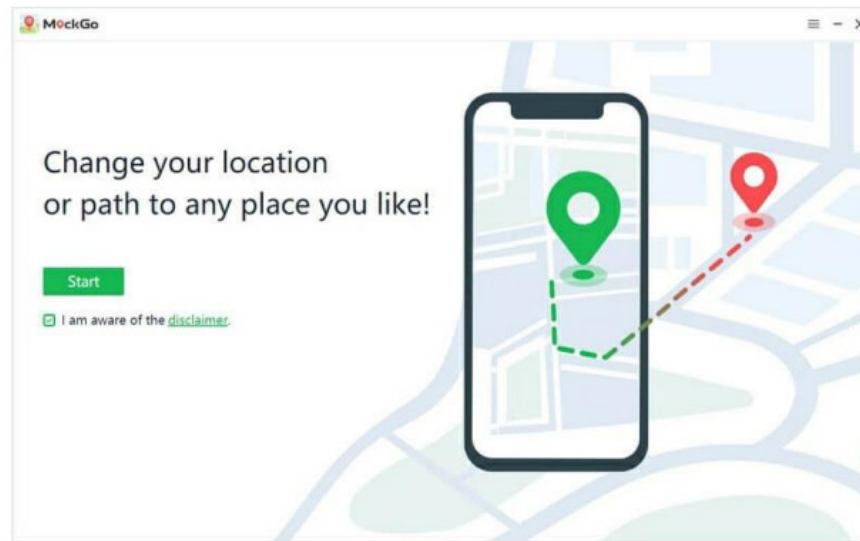

4. MockGo - iPhone GPS Spoofer

This software from foneazy allows you to change the location of your iOS devices to anywhere in the world. Using this software, you can simulate GPS movement by moving along roads, and joystick support is also available.

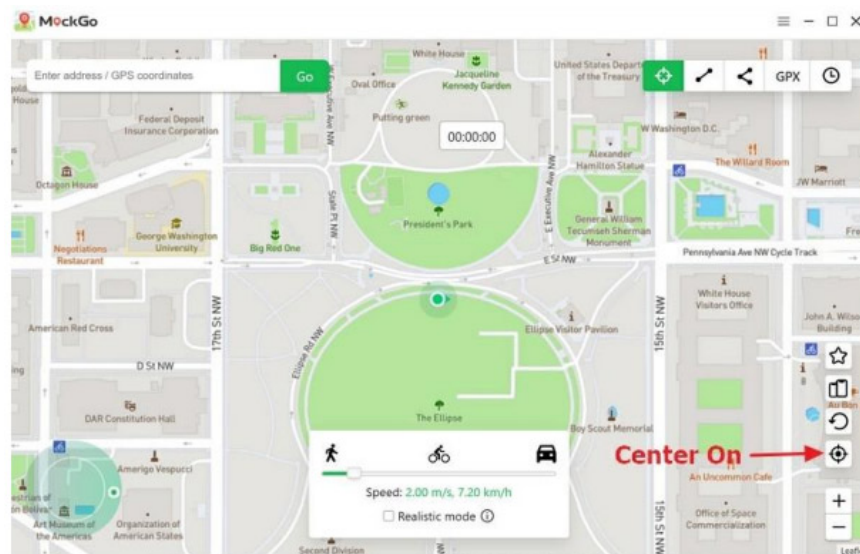

To add desired locations, you can even add GPX files and have an option to change the location of up to 5 devices at once. You can even create and save a collection of favorite locations and routes using the software.

Steps to change your virtual location using MockGo-iPhone GPS Spoofer

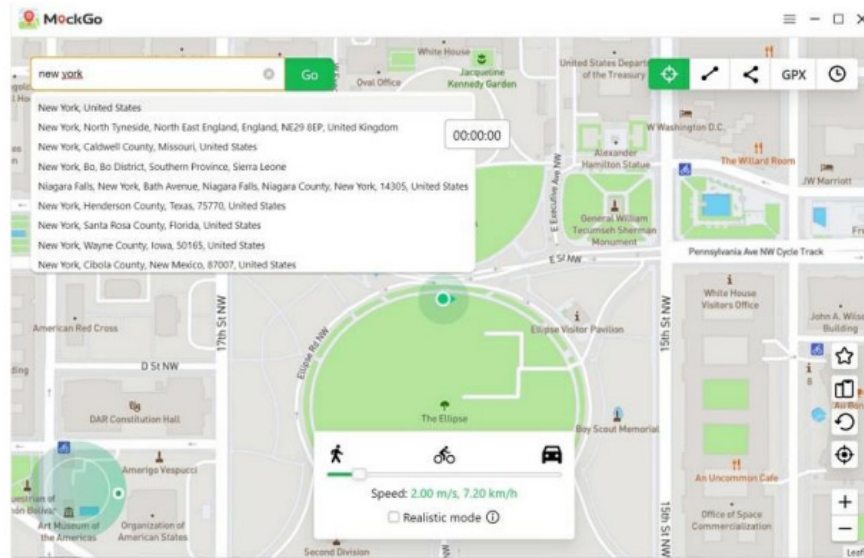

Step 1. Download, install, and run the software on your system. Connect your iPhone to your system using a USB cable, then press the **Start** button.

Step 2. In the new window, you can see your current location. To adjust your location if needed, click the **Center On** button in the bottom right corner.

Step 3. Next, in the upper right corner, tap the Teleport Mode icon, then enter the coordinates or address you want to set into the search bar. Click the **Go** button to search for the entered location.

Step 4. The software will now display the GPS location of the selected destination on the map. To move to this location, click the " **Move Here**" option . The device's location will now be set to this GPS location.

Above are some tools to change your virtual location, and each program has its own set of functions. If you want to easily fake your location on your Android and iPhone, iMyFone AnyTo GPS is the best software. Using this tool, you can change your location for gaming, make yourself appear in different locations, hide your current location, etc. The software is easy and quick to install and has a user-friendly interface.
