

How to change the volume of Siri on the HomePod

The HomePod and HomePod mini speakers are designed to automatically adjust the volume of the Siri virtual assistant based on the ambient sounds, but you can completely adjust the volume of Siri separately from the music player running.

In the article below, TipsMake will guide some of the commands you need to specifically adjust the volume of ? Siri?.

How to change the volume of Siri on the HomePod

On HomePod or HomePod mini, you can ask Siri to set a fixed volume level, which is a separate adjustment from the media player.

To do this, say 'Hey Siri, change your volume to [percentage]', or say something else as long as Siri can understand it.

For example, if you tell Siri to set the volume level to 34%, it will adjust even though the music volume stays the same. Siri can be forced to speak louder or lower than the volume of the music that is playing.

Change the volume of music on the HomePod

You can adjust the volume of media content with the same command, and this will increase or decrease the volume of the music without changing the volume of Siri.

To change the volume of multimedia content, say 'Hey Siri, change the media volume to [percent]'.

The volume of music can be adjusted using the + or - buttons above the HomePod or via a connected iPhone / iPad. However, adjusting the volume of Siri requires a command.

Note : A lot of users report that Siri's volume doesn't stay the same as on-demand forever, it will revert to default auto level about some time after playing on request. Unfortunately, there is no way to fix this at this time.
