

# How to clean up your computer, delete junk files, and optimize your system using CCleaner.

Knowing how to clean up your computer and optimize your system using CCleaner will help your device run faster after a period of processing many tasks and running software. CCleaner will scan and remove all junk files, repair the Registry, etc.

**CCleaner** is a very popular software on computers running the Windows operating system. The program helps you clean up system logs, junk files, temporary files, history, cookies, etc., to free up storage space, optimize the system, defragment, and speed up your computer like when it was new.

## How to speed up your computer using CCleaner

Besides CCleaner, there are many other popular software programs available on TipsMake that support cleaning and optimizing your computer, such as TuneUp Utilities and Wise Care 365. **Wise Care 365**, in particular, helps you remove old junk data from your hard drive, Recycle Bin, and other Windows components, freeing up memory and making your computer cleaner.

## *Instructions for cleaning your system using CCleaner*

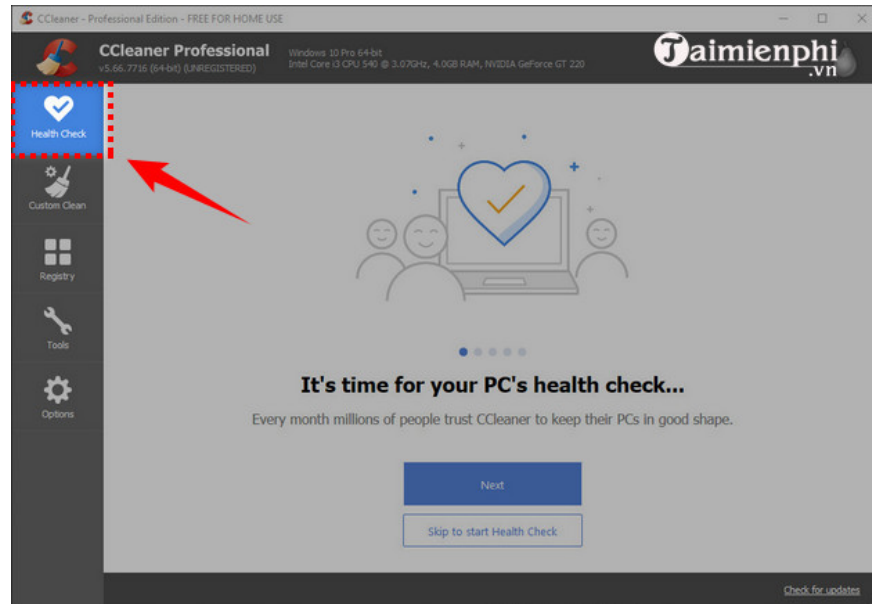

You should download and install the latest version of CCleaner for better support: [Download CCleaner](#)

Installing **CCleaner** is very simple; you only need to click a few steps to start using the program.

The main interface includes 5 sections: **Health Check, Cleaner, Registry, Tools, and Options** .

\* **The Health Check section** includes functions such as:

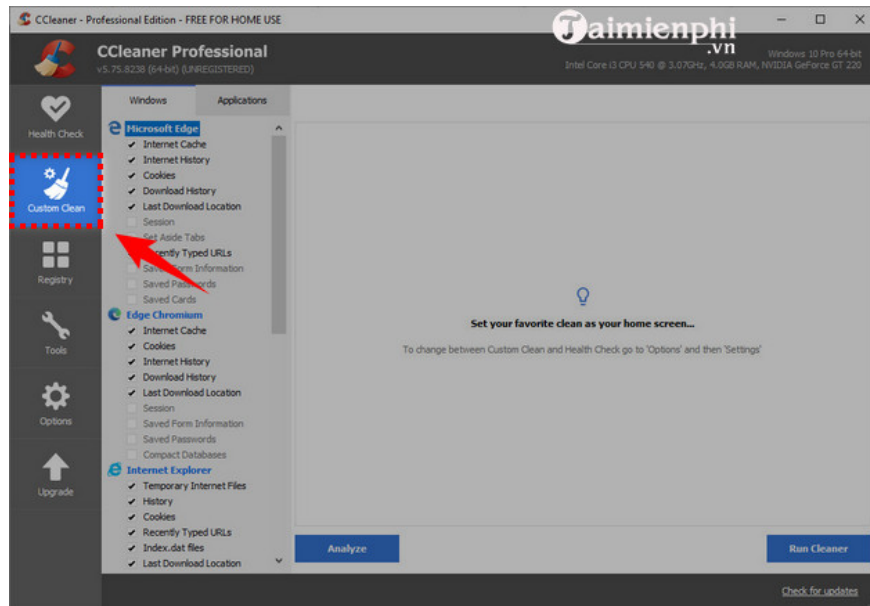

Checking your computer's health helps improve security, remove malicious websites, defragment your hard drive, and make your computer run faster.

\* **Cleaner section** : Consists of 2 tabs : **Windows and Applications**

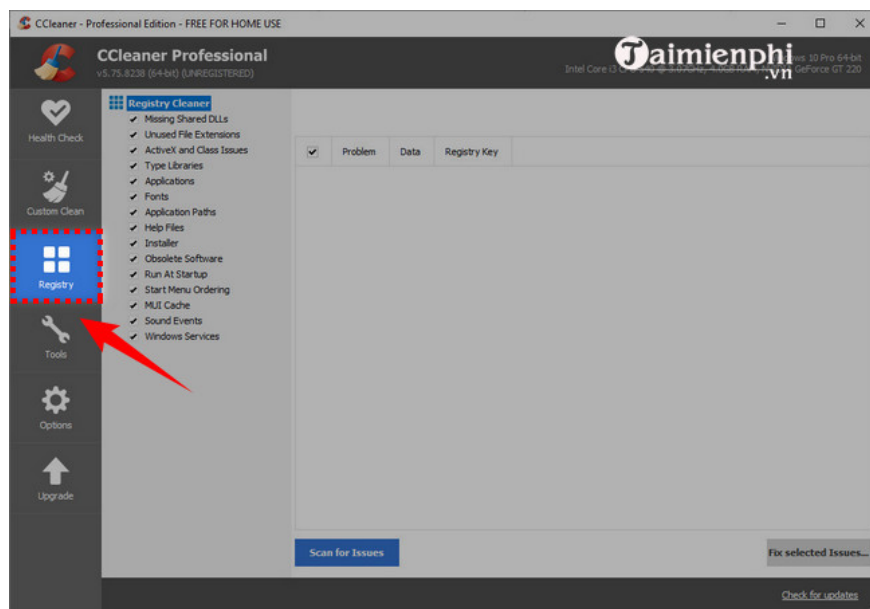

- **Windows** tab : includes functions to clean up log files, junk files, temporary files, history, cookies, etc., of the Windows operating system. Select the type of files you want to clean by ticking the corresponding box.

- **Applications** tab : This tab includes functions to clean log files, junk files, temporary files, history, cookies, etc., from applications. Select the type of files you want to clean. Applications here could include: Firefox, Microsoft Office, Adobe Reader, etc.

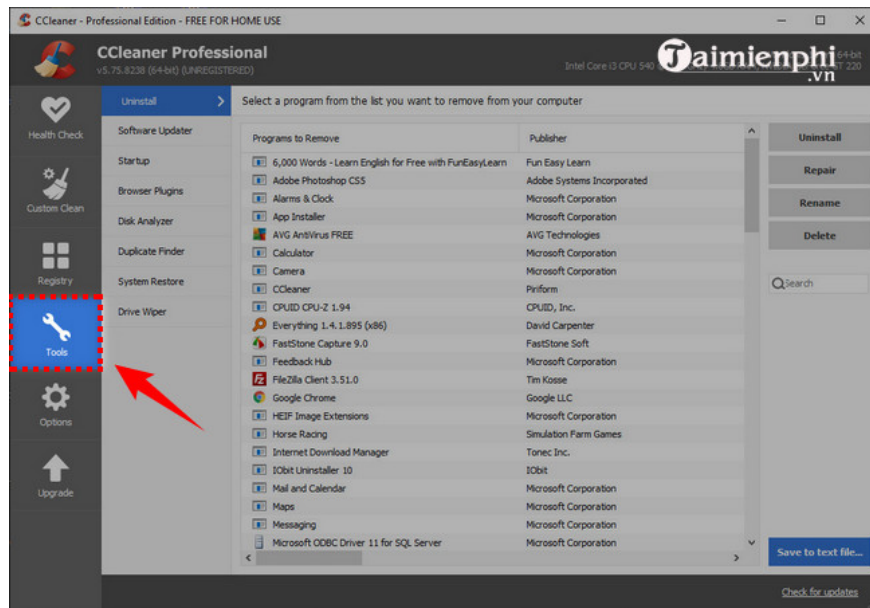

**\* Registry entry :**

During the execution of files, cache is always stored in the Registry, which is one of the reasons why computers run slowly. The program will search and filter out unused cache files in the Registry to clean them up. We just need to select the types of files to remove, such as library files, service files, application paths, DLL files, etc.

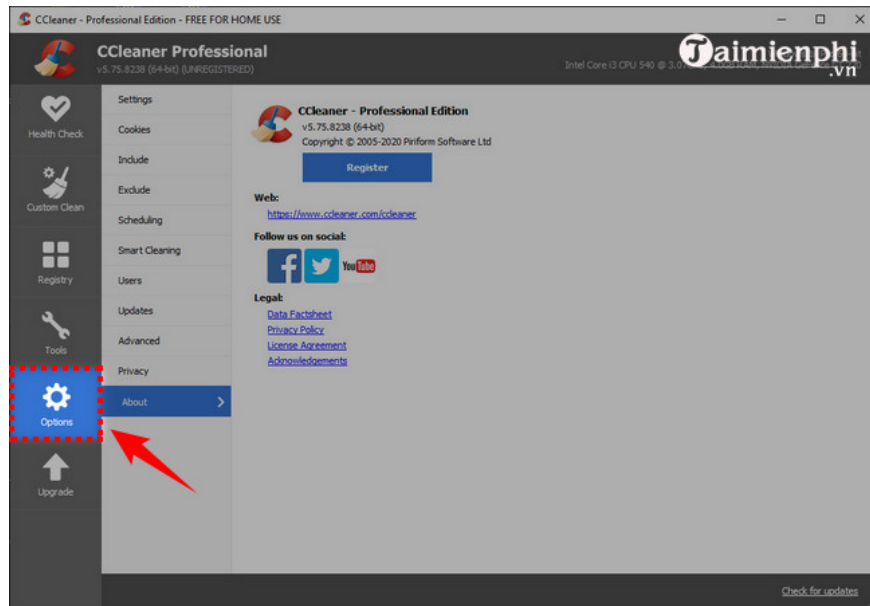

**\* Tools section : Includes 5 tabs**

- **Uninstall** tab : functions like Windows' add/remove program, but it's only used to remove applications already installed on the computer, rename them, or delete settings configured in the Registry. - **Startup** tab : selects applications that will start with Windows, applications that start when Internet Explorer or Firefox is opened. Similarly, we can disable or delete applications as desired. - **File Finder** tab : searches for duplicate files on the hard drive. We can search by name, size, modification date, or content. - **System Restore** tab : manages versions used to restore the system. - **Drive Wiper** tab : similar to Windows' defragmentation program.

\* **Options section** : includes 6 tabs

- **Settings** tab : Basic settings for CCleaner. - **Cookies** tab : Select the types of cookies you want to keep on your computer, so that when you run **Run Cleaner** in CCleaner, those selected cookies will not be deleted. - **Include** tab : Select the types of files (\*.tmp, \*.log, etc.), folders, or drives you want to delete when running the program. - **Exclude** tab : Select the types of files (\*.tmp, \*.log, etc.), folders, or drives you want to delete the settings and usage parameters in the Registry when running the program. - **Advanced** tab : Advanced settings for CCleaner. - **About** tab : View the version of CCleaner you are using.

CCleaner is considered the best system cleaning and optimization software currently available. Its usage is quite simple; you can easily remove junk files, browser history, and more from your system. Besides CCleaner, you can also optimize your computer system with BeeDoctor and remove viruses using BeeDoctor – a professional system optimization and virus removal software.
