

How to compress and decompress files on iPhone

On iOS 13, there is a feature to compress and decompress files so you can easily send mail without having to use another application.

From iOS / iPadOS 13 and above, the operating system has been provided with a lot of new features to change to help users more convenient to use, as well as to bring more interesting experiences. And the file compression and decompression feature on iOS / iPadOS 13 has helped us a lot in reducing the size of the file, especially sending files right on iPhone / iPad. Previous operating systems that want to compress or decompress need a different application, but with iOS 13, you immediately use the available features. The following article will guide you how to compress and decompress files on iOS / iPadOS 13.

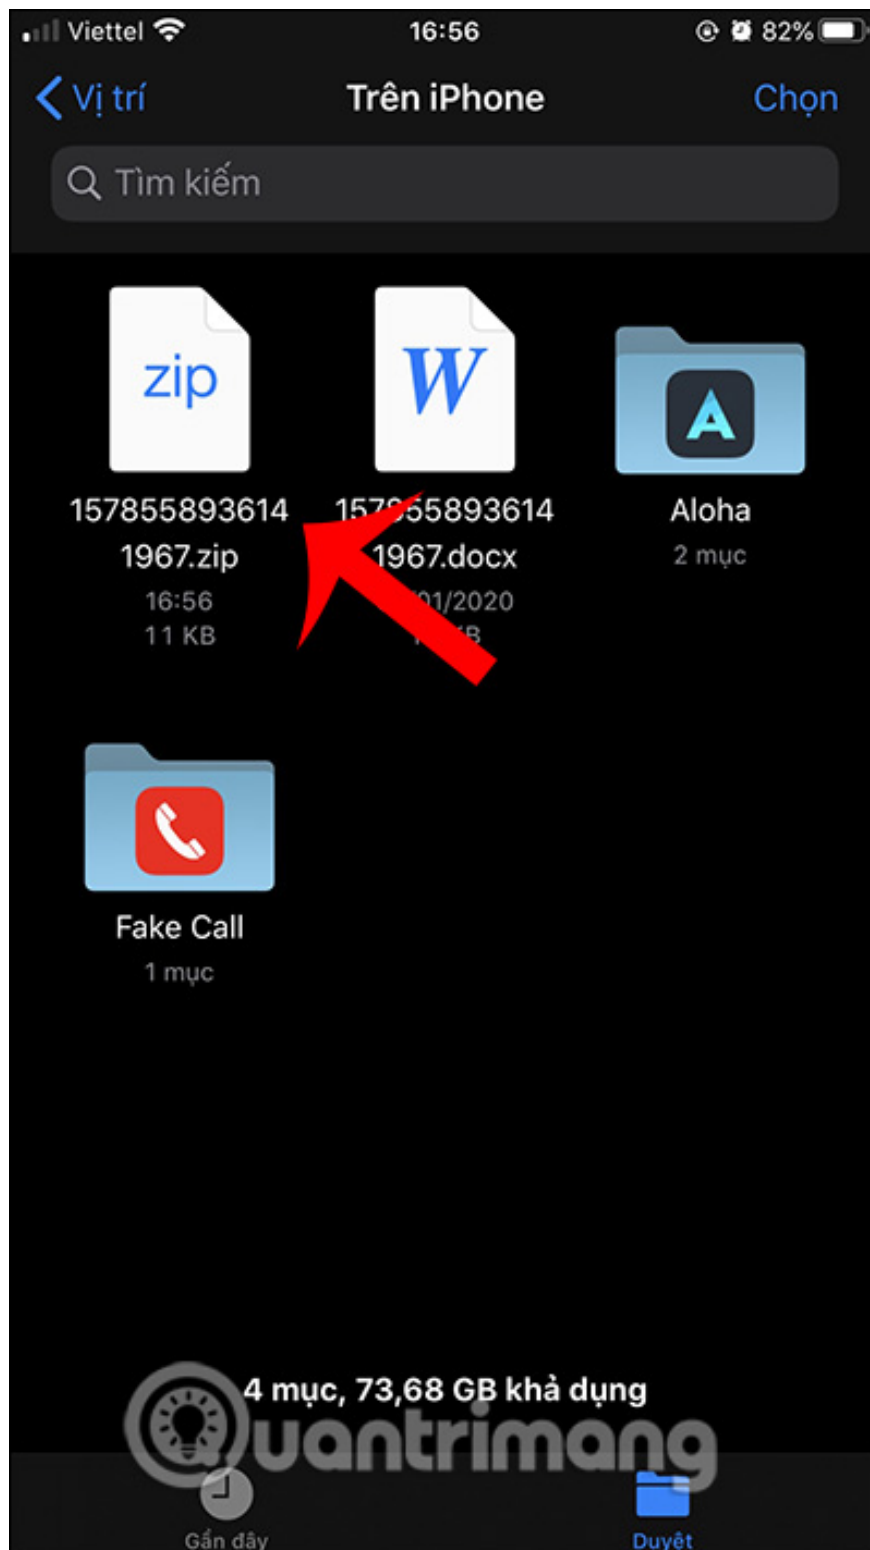

Instructions to compress and decompress files on iPhone

Step 1:

Users open the Files app on iPhone or iPad, then **press and hold on the file you want to compress** . If you want to compress multiple files at once, you should group them into one folder. Then display the interface as below, **click Compress** . As a result, you have got the file zipped file.

- Nén** 

Step 2:

Now you can press and hold on the compressed file and **select Share** . We then choose how to share data on the iPhone, with a lot of options such as sending via the application or sending via Messages depending on the user choice. By default, compressed files on iOS 13 are in .zip format.
