

# How to connect WPS-enabled WiFi on the phone

The following article will guide you how to connect to WPS Wifi using your phone without a password. If you do not want to enter a difficult to remember and complicated password, follow the way below!

Currently, WiFi is the most used wireless network system in the world. This network is convenient in that you can connect to the network anywhere without using the cumbersome network wiring, especially useful for devices like laptops or smartphones. Users tend to install complex and hard-to-remember passwords to protect their home WiFi, however, you can use WPS (WPS has the full name of Wi-Fi Protected Setup - this is the assistive technology. WiFi connection is easier than ever.) to connect to WiFi without a password. The following article will show you how to connect WPS-enabled WiFi on your phone.

1. Free WiFi access with Android ZiPi application
2. Instructions on how to change FPT WiFi password

**Step 1:** First, make sure the WiFi router is turned on and has the WPS option. Press the **WPS** button on the front of the modem once. The WPS button will blink orange to let you know it is ready to accept WPS connection.

**Step 2:** Press the "Apps" button on the phone, then select **Settings**

**Step 3:** Click on the WiFi icon in the settings

**Step 4:** Click Options (3 dots along the top right of the screen). These options may have different interfaces on different devices.

**Step 5:** Click **WPS Push** , then wait 2 minutes to make the connection.

**Step 6:** After completing the process, click **OK** .

So you have successfully connected WiFi!

Watch the video below to better understand how to do it!

**Note:** This method is only available on Android 4.0 and above versions.

Although WPS is not as secure as the WPA or WPA2 connection, it is still a useful feature for most home WiFi routers. Try using WPS on your phone to connect to WiFi to see if it's easier to use your password.
