

How to cool down quickly when your iPhone is hot

Below are specific instructions on how to cool down the iPhone when suddenly the phone is hot.

The hot iPhone during use is very popular, comes from many causes such as: Because users leave the phone in a place with high temperatures; both use and charge; Use multiple features at the same time; use a non-genuine charger cable . However, if the iPhone is hot for a short time due to user overload is common error but if used after making the phone overheated, you need to bring out Store inspection and immediate processing.

To limit the situation of hot iPhone while using, users need to apply some simple and effective tips below to avoid losing repair money.

Reboot the phone

Restarting the phone will allow users to close all applications that may be hanging.

Keep the phone in a cool place

Leaving the phone in a location with a high temperature will cause the phone to overheat thereby affecting the battery and also causing the display error. Especially if heavy can cause the screen to black and the battery may be permanently damaged. Therefore, you should avoid using your iPhone in hot weather and heavy tasks or leave it in direct sunlight.

Turn off unnecessary connections

When not using the connection such as 3G, 4G, wifi, it can be turned off. Instead, let the device rest for a certain period of time.

Remove the phone case when charging

Although the phone case will help protect the phone against many influences and help bring beauty to the phone. However, it can also cause the phone to heat up while charging and using the case.
