

How to create braille effect in Photoshop

The braille effect in Photoshop is also often used when we want to highlight textual content in images.

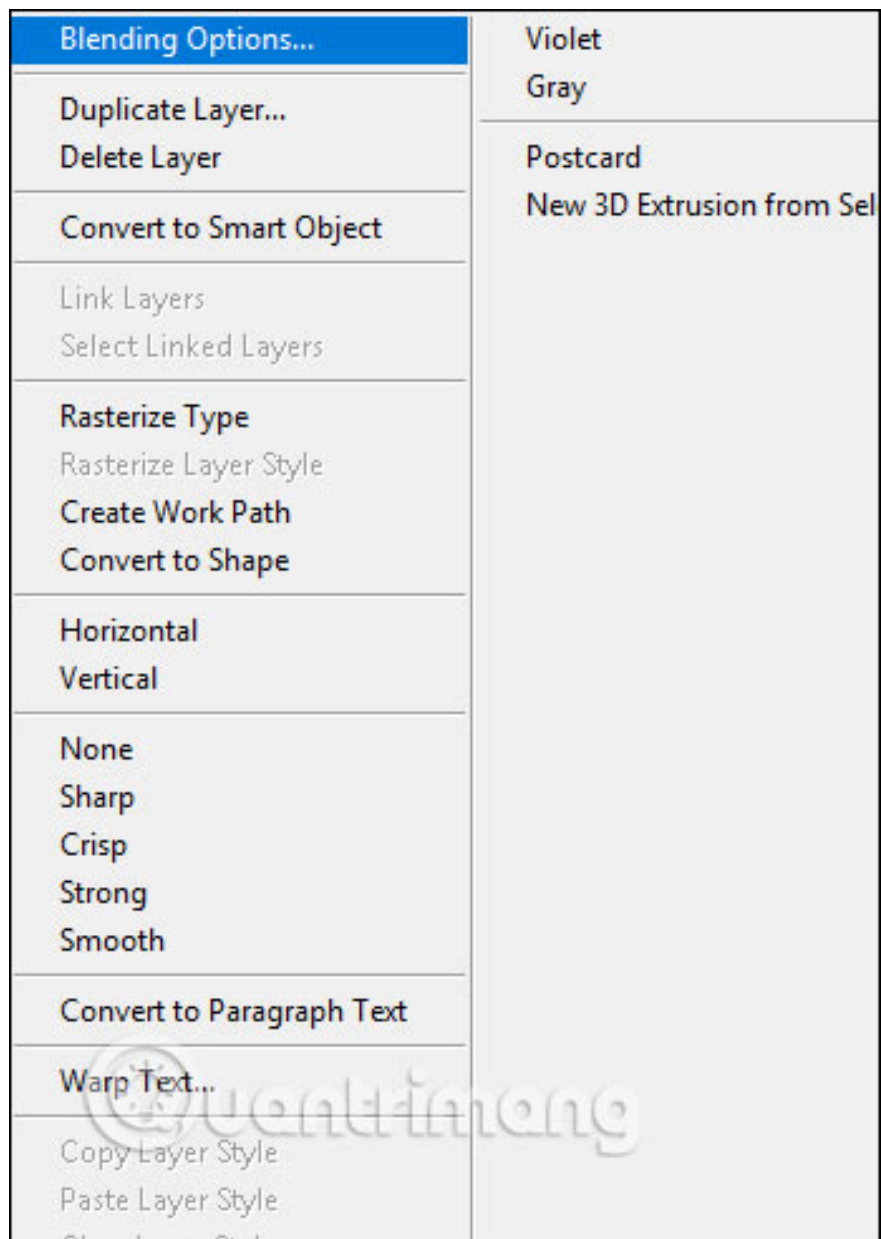

The use of text effects is essential when you want others to pay attention to the content displayed in the image, creating more attention to people. In Photoshop, you are provided with many tools to create effects for text, from complex to simple styles. For example, create a ray of light for text in Photoshop, the fire text effect in Photoshop. Or if you want to be simpler and still get a certain amount of attention, you can create a braille style. This type of braille is not sophisticated in appearance, very easy to implement. The following article will guide you how to create braille in Photoshop.

How to create braille in Photoshop

Step 1:

Users press **the Type Tool** or the T key to **write text in photos in Photoshop** , choose the size, type of font freely for you.

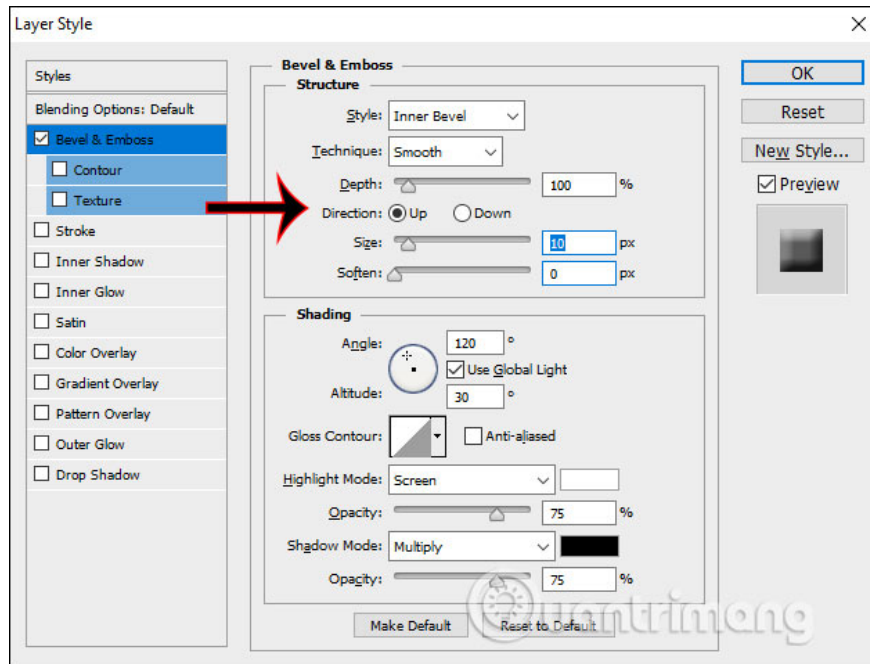

Next, right-click on the text layer and select **Blending Options** . in the displayed list.

Step 2:

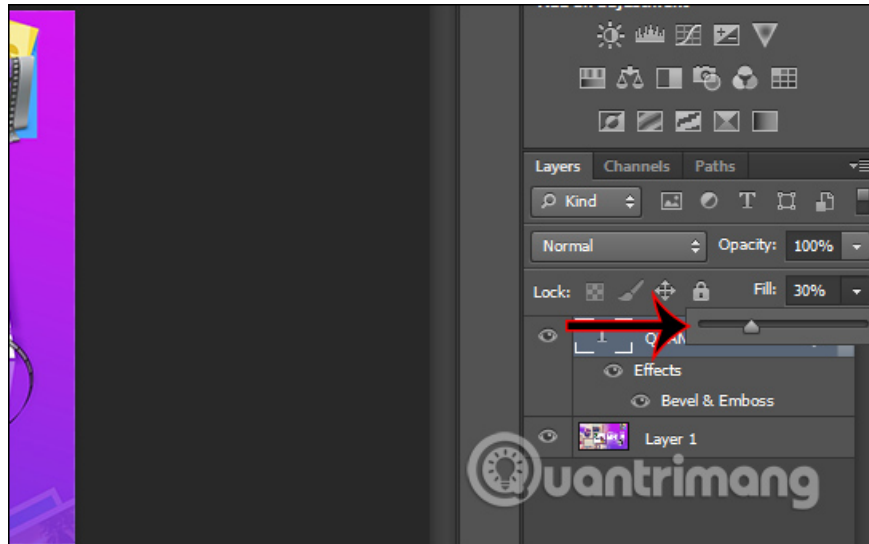

Display the Layer Style interface, select the **Bevel & Emboss** and **set the parameters** at **Structure** as shown in the picture. These parameters are not necessarily in the shape that you can change. We should both view the image and adjust it to create the braille effect you want.

After adjusting, click OK to save.

Step 3:

At the text layer we click on Fill and **reduce the Fill to 0** to blur the text. Or if you want to have color, just reduce the Fill to the level you want, not 0.

As a result, we have the floating effect typeface as shown below.
