

# How to Defrag a hard drive with the Disk Defragmenter function

Fragmentation of the hard drive is one of the causes of slow and unstable computer performance. And the Disk Defragment function available on the system is a great tool for you at this time.

**Disk Defragment** is a function available in Windows that defragments your computer's hard drive most effectively. This function will help you scan the entire hard drive, check the level of hard drive fragmentation and perform drive defragmentation. Using the Disk Defragment function ensures your computer operates stably and accelerates many times more.

## How to use Disk Defragment

Step 1: Open My Computer, and right-click any drive on the computer, and select Properties

Properties window appears, select Tab Tool -> Defragment now . the inspection process begins

Step 2: In the Disk Defragmenter window, select Analyze Disk so that the system can check for fragments appearing on the hard drive?
