

How to delete dynamic effects on PowerPoint

We can delete or disable an effect on a slide or the entire effect in a PowerPoint file.

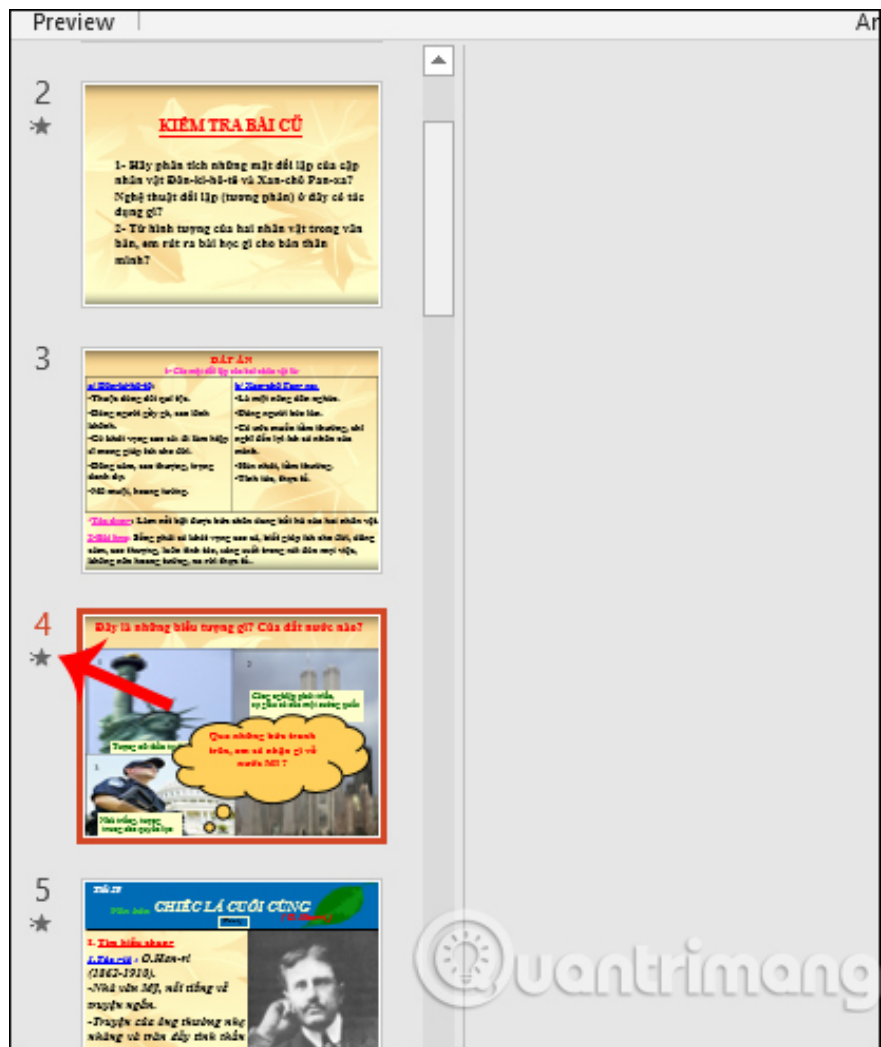

Using motion effects when composing PowerPoint slides is a basic and necessary operation with any presentation. For each different content object, as well as the purpose of the user presentation you choose the type of effect accordingly. Each type of effect on PowerPoint is grouped into individual effect categories such as Exit effect group, Entrance effect group, etc. for more convenience in selection. Changing the effect used for the object on the slide is also very simple. You can change to any new effect, or even delete individual effects or all effects used on PowerPoint slides. The following article will show you how to disable effects and delete used effects on PowerPoint slides.

1. How to create a guessing game on PowerPoint
2. How to create a countdown timer on PowerPoint
3. How to make PowerPoint fireworks effect
4. How to create handwriting PowerPoint effects

1. How to delete PowerPoint motion effects

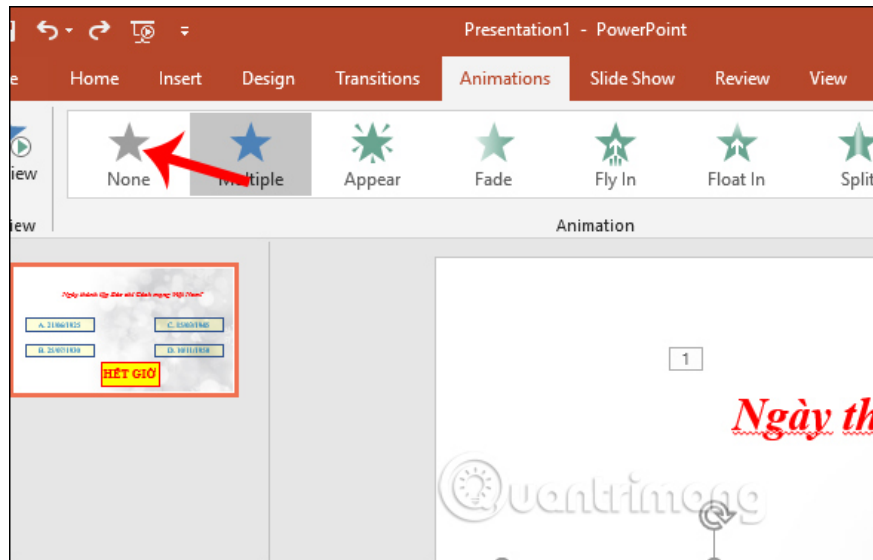

Step 1:

In a PowerPoint file, any slide that uses motion effects will have a star icon as shown below. Click on the slide to delete the motion effect.

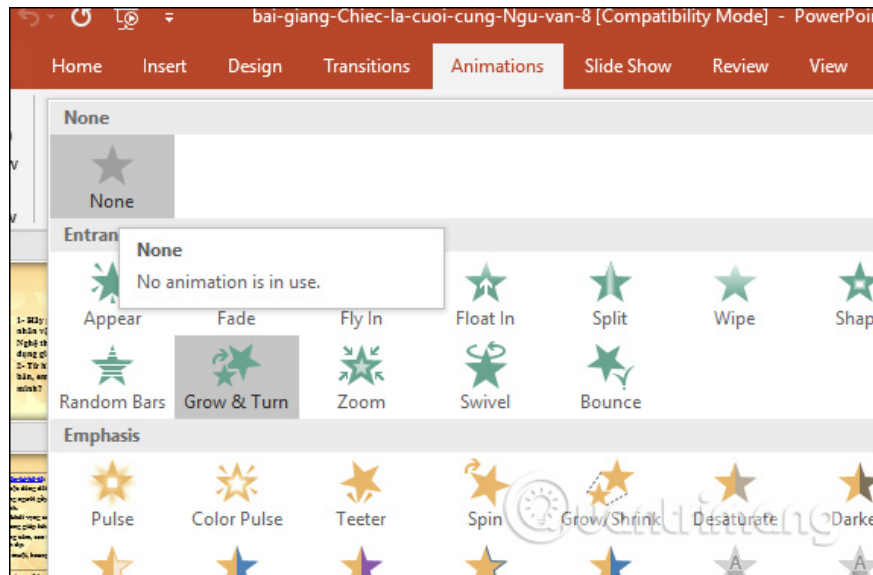

Step 2:

Next, click on the **Animations** tab and then select the slide content object to delete the motion effect, be it images, text content or frames. Click on **None** at the bottom bar to delete the animation effect used.

In case the user does not see the None option, you can click on the triangle icon to expand the effect frame on the slide. Then the None option always appears at the top of the frame.

Immediately the selected object will no longer have an effect. If you want to select the effect of many other objects on the slide, then press Ctrl and click on those objects and also select None.

Step 3:

To **delete effects on a slide show**, press Ctrl + A to surround the entire slide and also click on the Animations tab and then select None to remove the effects currently used for the selected slide. Repeat this operation to delete all the motion effects on the remaining slides you want to delete.

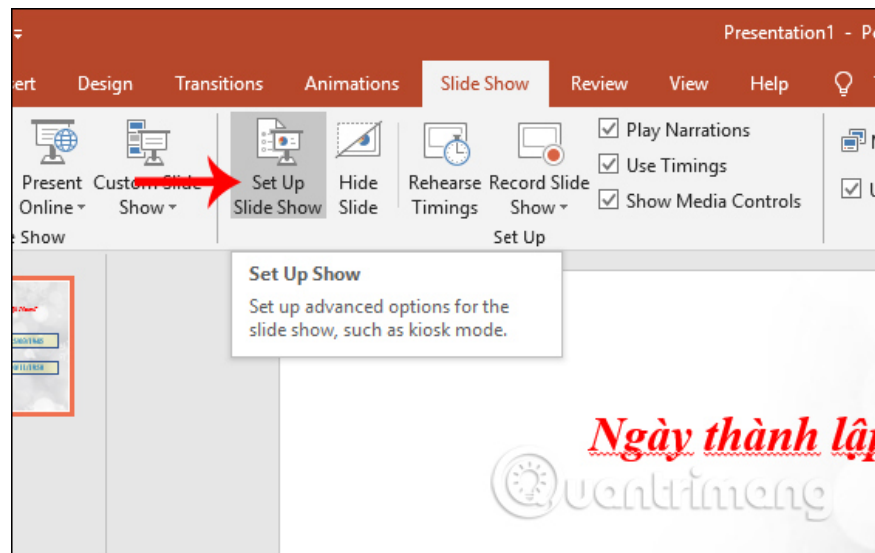

2. How to disable PowerPoint animations

If the animation has been deleted, the effect is no longer displayed on the slide, disabling the animation only shuts down the effects when you present the content and they are still displayed when you return to the slide editing mode.

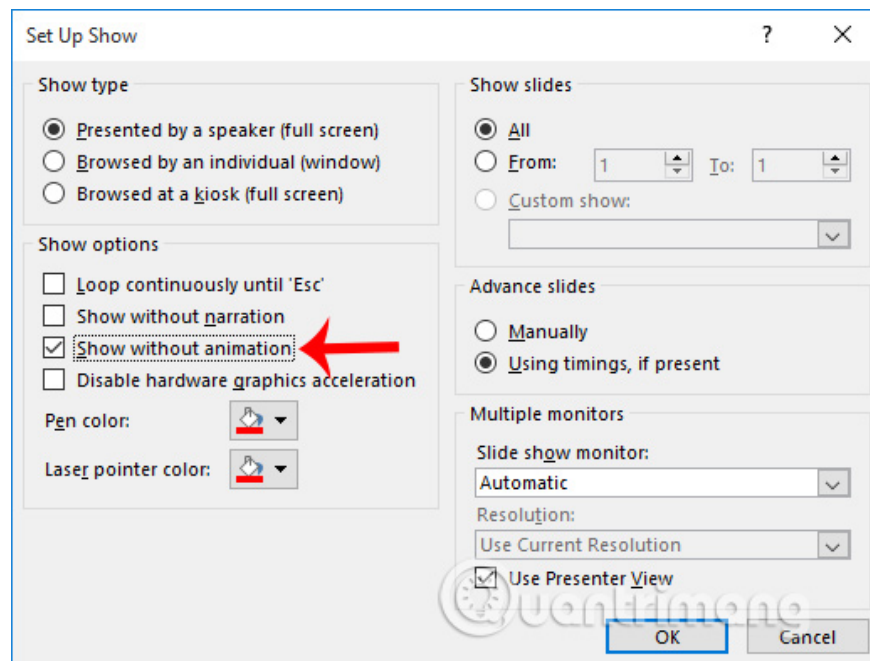

Step 1:

At the PowerPoint slide there is a user transition effect, click on the **Slide Show** tab, then select **Set Up Slide Show** right below.

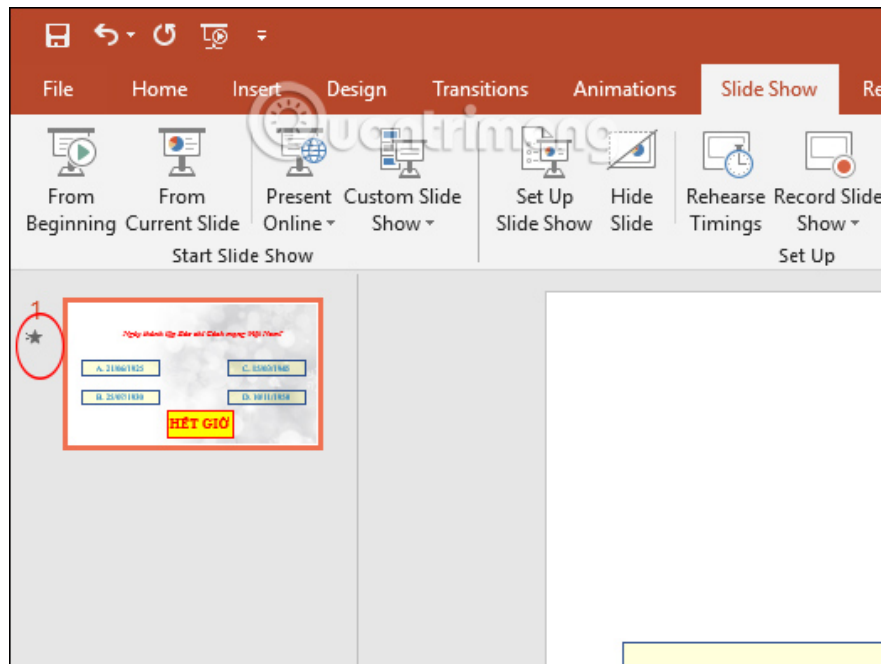

Step 2:

Switch to the new interface, in the **Show options** area select on **Show without animations** and then click OK to save.

The motion effect is still used in the slide through the star icon at the slide, but when you show it, the animation effects are not used.

To review PowerPoint slides with user effects, just uncheck it at Show without animations.

So we have two ways to not use motion effects in PowerPoint slides, delete effects of some objects on a slide or delete effects in the entire slide and disable existing effects in the slide. Disabling will only be appropriate in the case of a slide show, as it does not want to show motion effects. The display of the effects is also very simple through setting in Slide Show.

I wish you all success!
