

# How to detect sneaky people on your Facebook

If you are curious to know where your Facebook account is being logged in, or you suspect someone has logged in to your Facebook account without your consent, there is a way to tell the correct account. Where your account has been logged in from, and in most cases, you may even know which device was used to log in to your account.

**If you are curious to know where your Facebook account is being logged in, or you suspect someone has logged in to your Facebook account without your consent, there is a way to tell the correct account. Where your account has been logged in from, and in most cases, you may even know which device was used to log in to your account.**

## 1. With iPhone and iPad:

1. Open the Facebook application from the home screen ( *Home* ) on your iPhone or iPad.
2. Touch the ' *More* ' item at the bottom.
3. Scroll down to the bottom and touch the account *settings* ( *Account Settings* ).
4. Touch the **Security** section .
5. Touch the **Active Sessions** section at the bottom.

Here you can see all access sessions to your Facebook account. If that's what you've visited, you'll probably recognize. And if you find strange access that you have never entered, it means that someone has stealthily logged into Facebook with your account.

If you see anything suspicious, you should change your password.

## 2. Activate login notification

To know who has sneakily logged into your Facebook account, the first way is to enable login notifications (Login Notifications).

With this feature when someone signs in to your Facebook account on another computer or on a mobile device, Facebook will send a warning message to you via text message or email.

### 3. Activate Login approvals

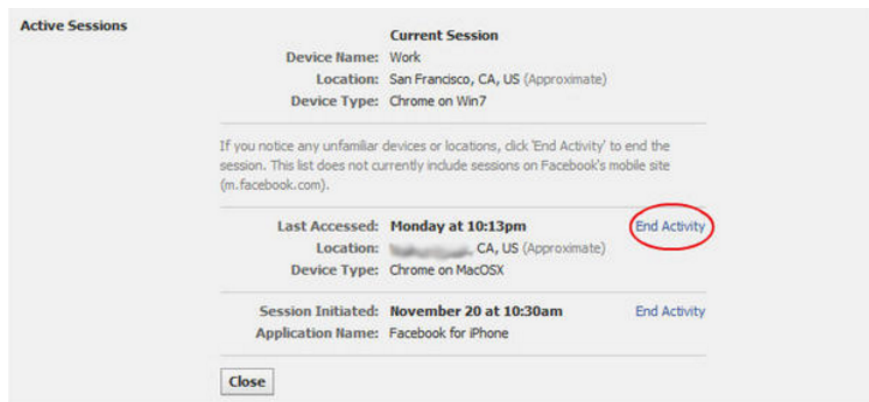

Facebook's Login Approvals feature is optional but Facebook users should know and use this feature to increase their Facebook account security.

When you enable this feature, you will have to fill in an authentication code that Facebook sends you via SMS whenever you log in to your account on the new device.

To enable this feature, go to Account settings (Account Settings), then click Security. In the right pane, select **Login Approvals** and check the **Require a security code to access my account from unknown browsers**.

### 4. Check login times

To know exactly where your account is logged, access **Active Sessions** . Here you will see a list of current versions at the top and a list of login times on different devices and computers at the bottom.

If you see any logins that look suspicious (you can know the login location too), click **End Activity** and change your password.
