

# How to get data from web into Excel

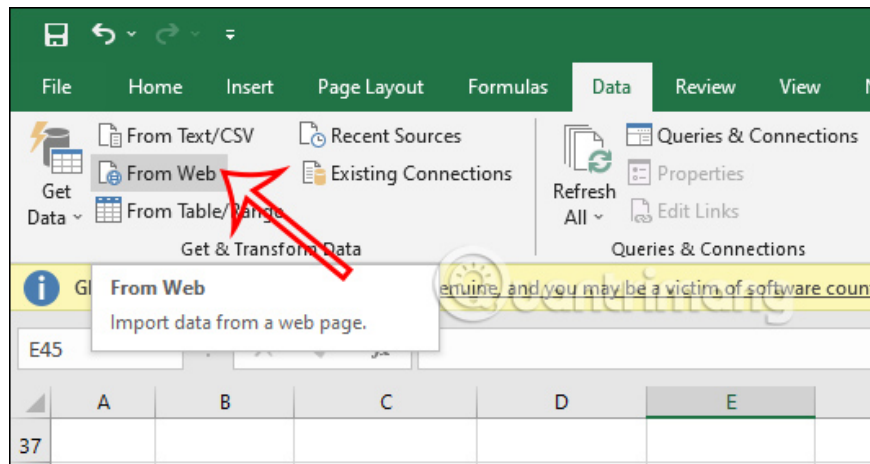

Excel has a feature to get data from the web into Excel, such as a price list, and can automatically update the data for the table according to the source data.

So instead of having to manually enter data, which is time-consuming and unprofessional, with this available tool, the data content from the web will appear immediately in Excel. The following article will guide you to get data from the web into Excel.

## Instructions for getting data from the web into Excel

### Step 1:

At the Excel interface, **click on the Data tab** and then click on the **From Web** tool as shown below.

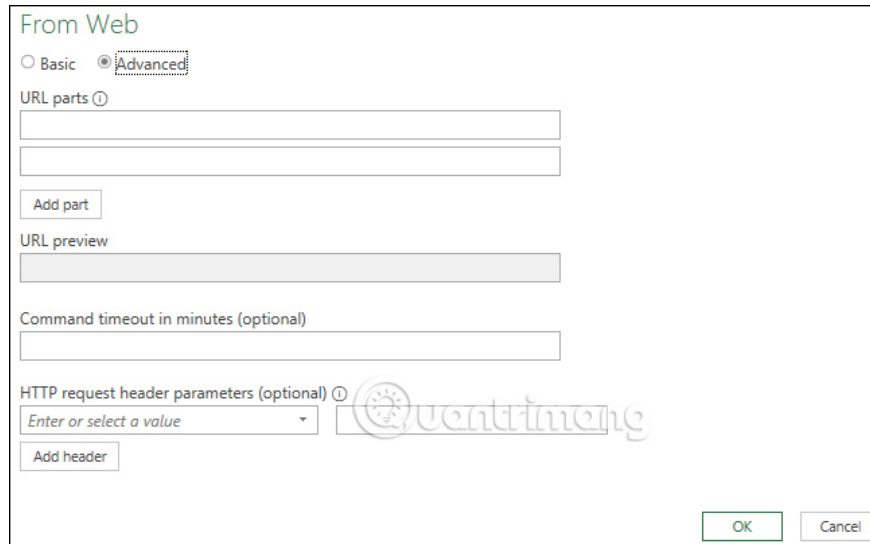

### Step 2:

Now the interface is displayed for you to **enter the website URL** that we want to get data from. You will have 2 options: Basic with entering the website link.

And the **Advanced option** has more settings.

The 'From Web' dialog box is shown with the 'Advanced' option selected. It contains several input fields: 'URL parts' (two empty text boxes), 'Add part' button, 'URL preview' (empty text box), 'Command timeout in minutes (optional)' (empty text box), and 'HTTP request header parameters (optional)' (dropdown menu with 'Enter or select a value' and 'Add header' button). 'OK' and 'Cancel' buttons are at the bottom right.

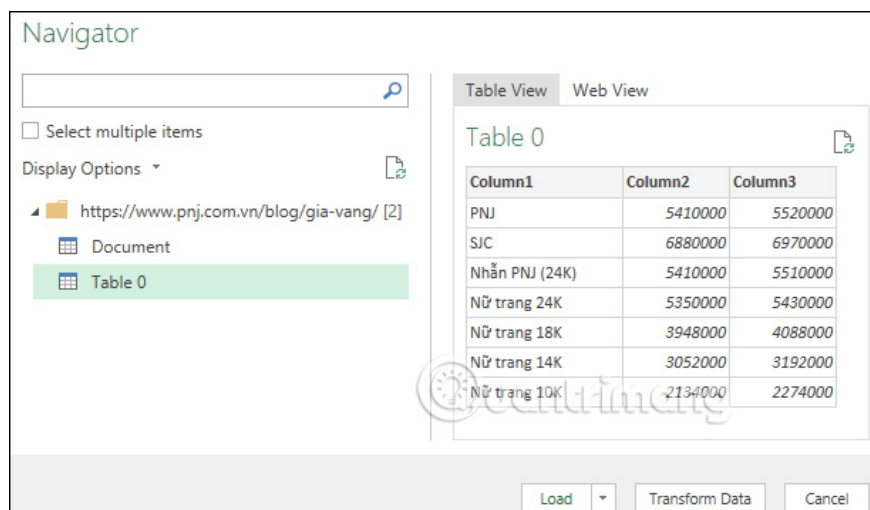

Here we will **click on the Basic option to paste the website URL** we want to get data into Excel. **Click OK** to continue.

The 'From Web' dialog box is shown with the 'Basic' option selected. The 'URL' field contains the text 'https://www.pnj.com.vn/blog/gia-vang/'. 'OK' and 'Cancel' buttons are at the bottom right.

### Step 3:

Immediately after that, the Navigator interface appears, click on **Table** to display the data table on the website or click Document to view the data.

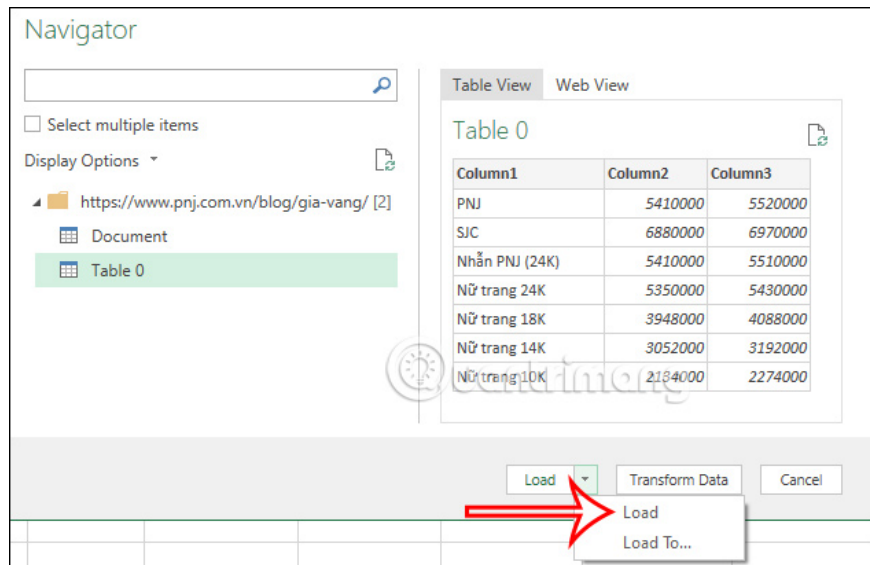

The Navigator interface is shown with a search bar and a list of items. The 'Table 0' item is selected. The 'Table View' tab is active, displaying a table with the following data:

Column1	Column2	Column3
PNJ	5410000	5520000
SJC	6880000	6970000
Nhãn PNJ (24K)	5410000	5510000
Nữ trang 24K	5350000	5430000
Nữ trang 18K	3948000	4088000
Nữ trang 14K	3052000	3192000
Nữ trang 10K	2134000	2274000

'Load', 'Transform Data', and 'Cancel' buttons are at the bottom.

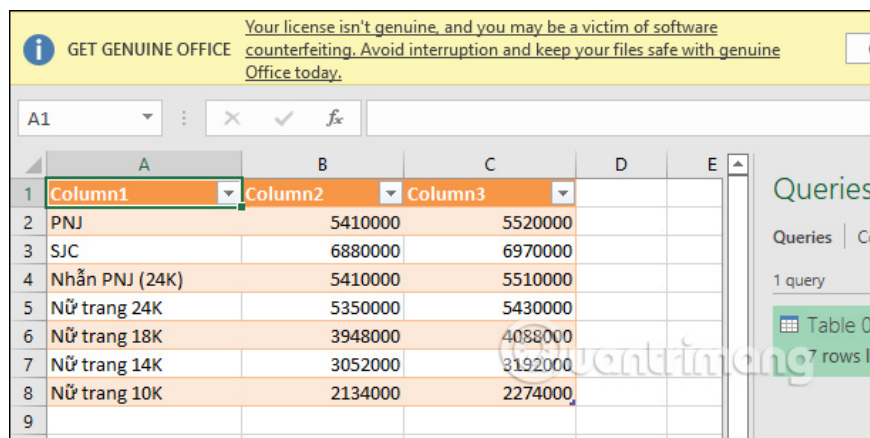

Then we will see the data displayed as shown below. Click **Load** to dump the data on the website to Excel.

#### Step 4:

We wait a moment for the data to display in Excel as shown below.

You proceed to change the data table interface, edit the font and color of the data table as usual and you're done.

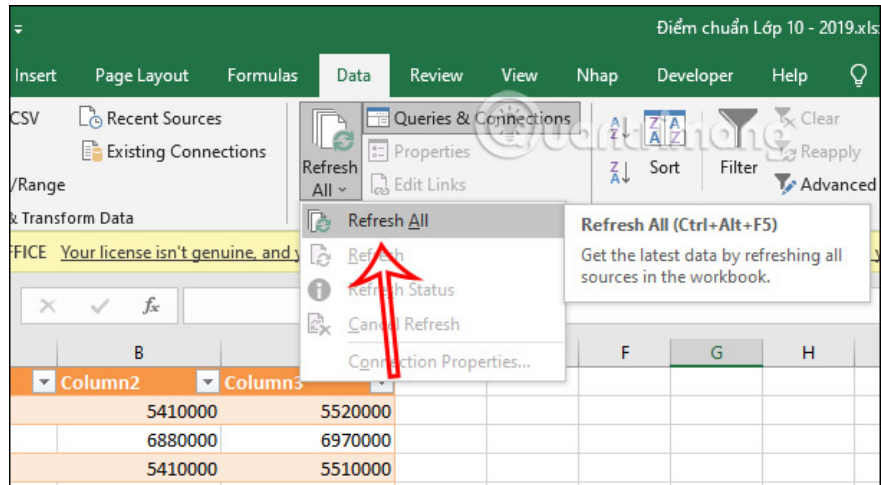

## How to update data in Excel from website

After inserting data from a website into Excel, in some cases, you also need to update the data from the original source. You can do it in 2 different ways.

### Method 1: Update Excel data from the web

At the interface in Excel, click on the **Data** tab and then click on the **Refresh All** command or press the shortcut key combination Ctrl + Shift + F5.

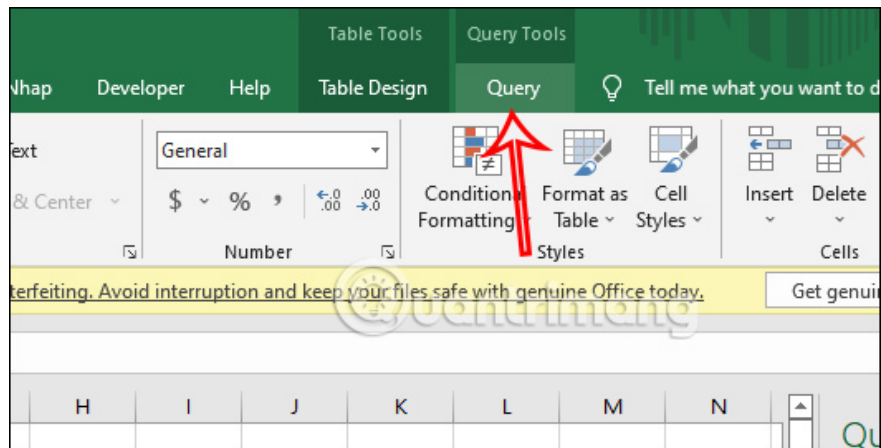

The data will then be updated according to the data from the website.

## Method 2: Update Excel data from the web automatically

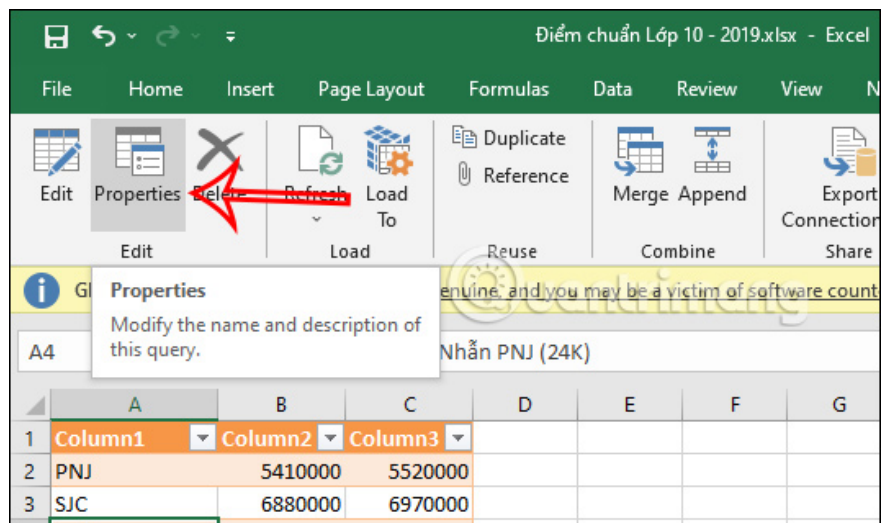

### Step 1:

First, click on the current **data table** and then click on the **Query** tab .

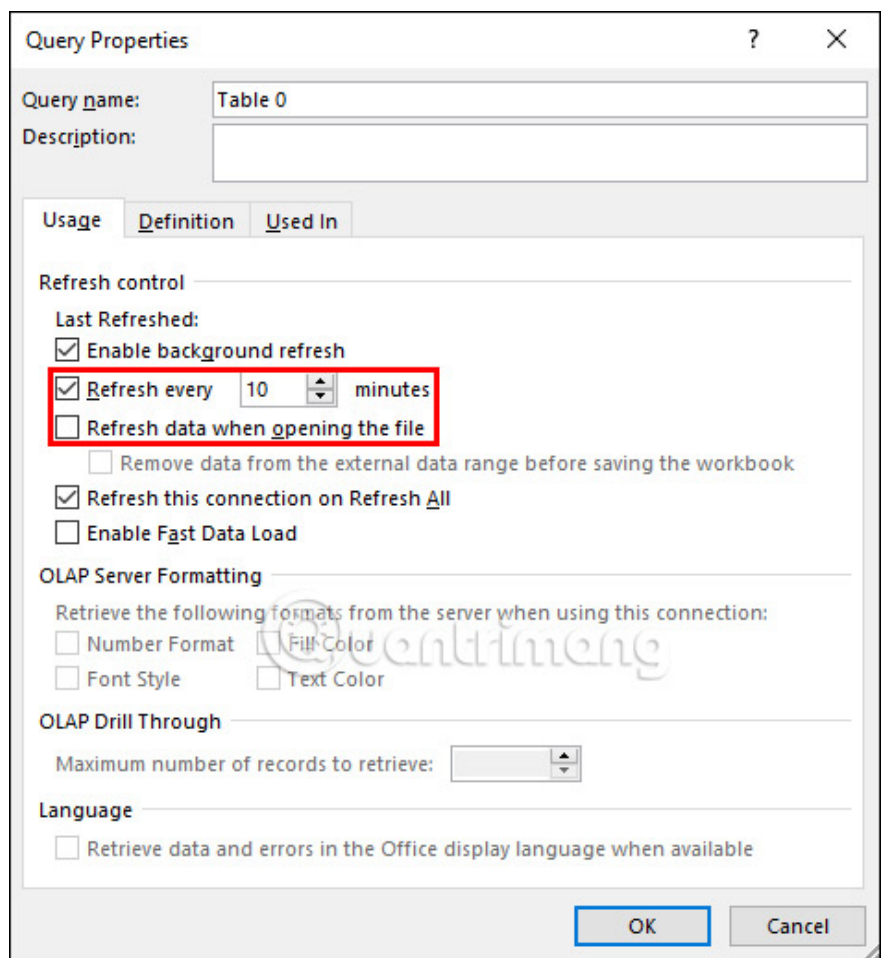

### Step 2:

Then look down at the Edit group **and click Properties** to set up automatic data table update mode.

### Step 3:

Display the interface, here you will **check Refresh Every** and then **enter the number of minutes you want to automatically update the data** . In addition, you can also check Refresh data when opening the file to update the data every time you open this table.
