Hacking a game is the process of editing the game's source code in order to gain an advantage. For example, you may hack a game to gain more health or lives. Hacking a game normally requires a sufficient understanding of how the game is...

 1. If you are using Mac, click **Download Cheat Engine 6.2 For Mac** instead.
 2. Beware of any pop-ups that try to get you to download other software or browser extensions. If you encounter pop-ups for other programs or extensions, click the option to close them, if it's available. If not, click **Continue** to open the download page in another tab, and then close the tab.
3. **Double-click the install file.** Downloaded files can be found in your "Downloads" folder on PC and Mac, or from within your web browser. Double-click the install file to install Cheat Engine. The install file is "CheatEngine70.exe" on PC, and "CheatEngineMac.dmg" for Mac.
4. **Click the radio button next to "I accept the agreement" and click .** You can read the agreement in the text box. Click the circle button next to "I accept the agreement" when you are ready to continue and click **Next** in the lower-right corner.

9. **Click .** This finishes the installation process.

Method 2 of 4:

Using Cheat Engine on PC

1. **Start a game.** Click the icon in the Windows Start menu, or Applications folder on Mac to launch a game. It game be any game you want.

2. **Run Cheat Engine as an administrator.** Cheat Engine has an icon with a blue "E". Log into an account with administrative privileges on your computer. Double-click the Cheat Engine icon in the Applications folder on Mac. On Windows, right-click the Cheat Engine icon in the Windows Start menu, then click **Run as an Administrator**.
3. **Click the icon that resembles a computer monitor.** It's in the upper-right corner of Cheat Engine. This opens a list of processes currently running on your computer.
4. **Click the process for your game and click .** The processes in the list usually have a string of characters followed by the name of the program (i.e. 00001664-The Sims 4).
5. **Select next to "Scan Type".** This allows you to scan for an exact number. This is useful for searching for an exact numerical value. Such as the number of objects in your inventory, or health percentage.
 1. If your value you want to change does not have a number value (i.e. a health bar), select "Unknown initial value" in the drop-down menu next to "Scan Type".
 2. You can also scan for values that are "Bigger than", "Smaller than", or values between a set of numbers.
6. **Enter the number of the object you want to change next to "Value".** It's in the panel to the right. For example, if you are playing a Call of Duty: Black Ops and you want to add more ammo, pause the game and enter the current number of bullets you have in the "Value" field in Cheat Engine. In another example, if you're playing The Sims 4 and you want to add more Simoleons to your household funds, pause your game and enter your current number of Simoleons you have below "Household funds" in the "Value" field in Cheat Engine.
7. **Click .** It's above the "Value" field. This searches for all addresses in your game with the number value you entered. The addresses are displayed in the panel to the left. Each of these addresses are variables from the game you are currently playing. One of them controls the object you want to change in your game (i.e. ammo in Call of Duty or Simoleons in The Sims 4). It's impossible to tell which address controls the object you want to change, so you will likely need to narrow them down.
8. **Change the number of the object you want to change in your game.** Return to your game and change the value of the object you want to change. For example, if you are playing Call of Duty: Black Ops and you want to add more ammo, you could fire a bullet to lower your ammo count by 1.^[1] If you are playing The Sims 4, you can buy something, like a snack from the refrigerator to spend some Simoleons in your household fund.
9. **Enter the new number in "Value" field and click .** For example, if you had 36 bullets during the first scan, and you fired 1 bullet, you would enter "35" in the Value field and click **Next Scan**. If you had 7,000 Simoleons in The Sims 4, and you bought a sandwich for 8 Simoleons, you would enter "6992" in the "Value" field and click **Next Scan**. This scans all the previous addresses for a variable that started with a value of "7000" and changed to "6992".
 1. If the value you want to change has an unknown initial value, select "Increased value" or "Decreased value" next to "Scan Type" depending on if the number increased or decreased in the game. This will scan for any increase or decrease in the values rather than a specific number.
 2. If you mess up during this process, you can always click **New Scan** and start all over again.
10. **Repeat as needed.** It may take a few scans to narrow down the addresses enough to where you can determine which one controls the object you want to change in your game. If needed continue to deplete your ammo/health/money in the game and adding the new value in Cheat Engine. Then click **Next Scan**.
 1. If you can't narrow the addresses down to just one, try to narrow them down to as small a number as possible.
11. **Double-click the address(es) that controls the value you want to change.** Once you've narrowed down the addresses enough to where you know which one controls the object you want to change, double-click it. It will appear in the panel at the bottom.

1. If there is more than one address, double-click all of them.
12. **Right-click the value(s) at the bottom of the screen.** This displays a pop-up menu next to your mouse cursor.
 1. If there is more than one address listed in the panel at the bottom. Hold **Ctrl** and click all of them to select all of them at the same time.
13. **Click followed by .** This displays a pop-up window that allows you to change the value of the address(es) you selected.
14. **Change the number value and click .** Enter the desired number of the object you want to change and click **Ok**. For example, if you want to 9999 bullets in Call of Duty: Black Ops, enter "9999" in the Value field and click **Ok**. If you want to give yourself 3,000,000 Simoleons in The Sims 4, type "3000000" in the "Value" field and click **Ok**.
15. **Click the checkbox(es) below "Active".** The checkbox is to the left of each of the addresses listed in the bottom panel in Cheat Engine. This makes the address value active in the game.
16. **Return to your game and change the object you want to change.** You should see it add or subtract to the value you entered in Cheat Engine, rather than the previous in-game value. For example, if you give yourself "9999" bullets in Call of Duty: Black Ops, next time you fire your gun, it should subtract a bullet from "9999" instead of the 35 bullets you previously had. Likewise, next time you make a sandwich in The Sims 4, it will take 8 Simoleons away from the 3,000,000 Simoleons you entered in Cheat Engine, instead of the 6,992 you previously had.
 1. This method works in general, but it won't work with every game.
