

How to insert spaces in HTML

This tutorial explains how to insert spaces and line breaks in HTML. Because no matter how many times you type a space, HTML will display a space so to insert more than one space, you will need to use the HTML tag.

This tutorial explains how to insert spaces and line breaks in HTML. Because no matter how many times you type a space, HTML will display a space so to insert more than one space, you will need to use the HTML tag.

How to insert spaces in HTML (non-breaking space)

Usually HTML only displays a space between words, no matter how many times you have typed it. To force the removed spaces to appear, type ` ` go to the place you want to insert.

For example typing `Xin chào .` will create an extra space between **Xin** and **Hello**.

This is called a space that is not broken or not destroyed because it prevents the line from falling in that position. If you abuse this character, the browser will be difficult to insert a nice and proper line break.

Can type ` ` to create space.

Insert longer spaces in HTML

You can use 1 of the following options:

1. Insert 2 spaces:
2. Insert 4 spaces:
3. Insert tab:

Back off the lines of CSS text

The Padding or Margin properties of CSS give direct instructions to the browser, so the result will be more consistent than using the tag

In the paragraph of text, insert the code below:
