

How to install fonts on iPhone, iPad

You can install almost any TrueType (.ttf) or OpenType (.otf) font on the iPad or iPhone. You cannot change the system font, but you can use installed fonts in Word, Excel, PowerPoint, Pages, Numbers, Keynote, Autodesk Sketchbook, Adobe Comp CC and more.

You can install almost any TrueType (.ttf) or OpenType (.otf) font on the iPad or iPhone. You cannot change the system font, but you can use installed fonts in Word, Excel, PowerPoint, Pages, Numbers, Keynote, Autodesk Sketchbook, Adobe Comp CC and more.

How to install fonts on iPhone, iPad

Step one: Download the font installation application

You must install the font using the iOS profile, although it is possible to create this profile on a Mac, but there is an easier way. Applications such as iFont, AnyFont and Fonteer allow you to download fonts on the iPad and then quickly pack it into the configuration profile to be easily installed. These applications allow users to install fonts in .ttf or .otf format. They also support .zip files with .ttf or .otf fonts inside them.

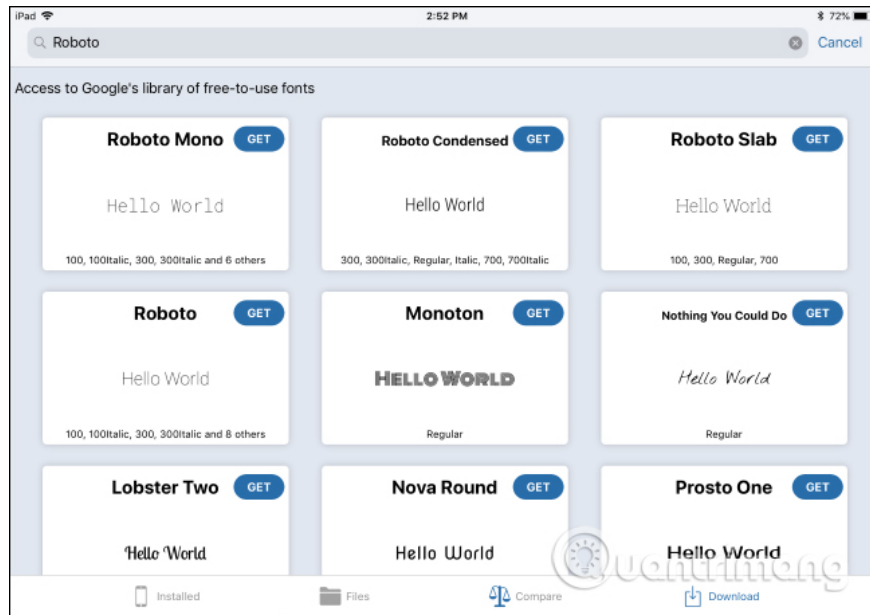

All three applications have similar behavior, but other interfaces. iFont is free with ad support, you can remove ads if you don't like it with \$ 0.99. AnyFont is priced at \$ 1.99 and Fonteer allows users to download three fonts but you will have to pay an additional \$ 1.99 if you want to install more fonts.

The article will show you how to use the iFont application to download fonts, if you use AnyFont or Fonteer, the same way.

Download : iFont

Step two: Download the font

To get started, you need to find and download the font you want to install. You can download fonts from within the application. For example, in iFont, you can touch the " **Download** " tab at the bottom of the application to see a list of fonts from Google's font library. Then you can search for any font in this library and click the " **Get** " button to download the iPad.

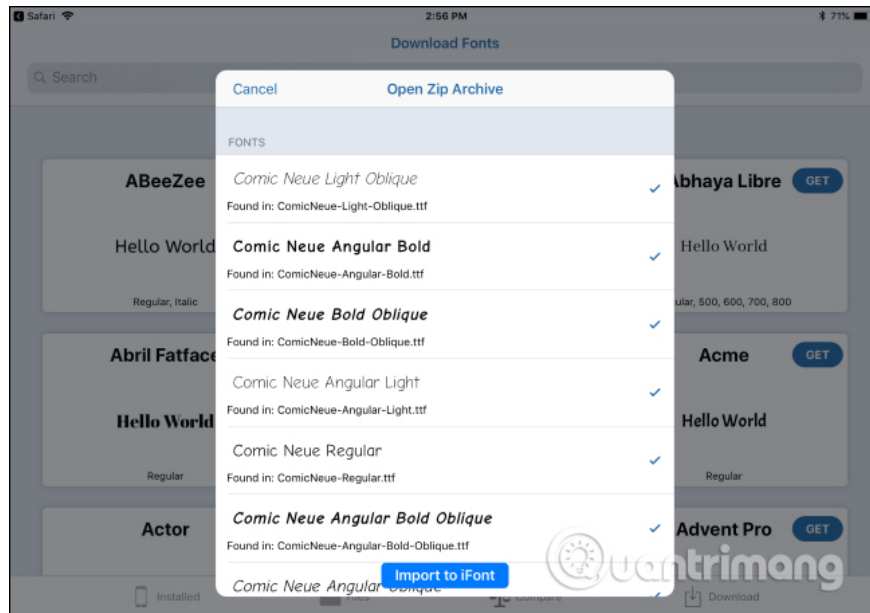

In addition, you can also download fonts from the website. Visit the font download website in Safari web browser, then touch the download link. If the font is available as a .zip, .ttf or .otf file, you'll see an option to ' **Open in iFont** ' or another option on the application you choose.

If you don't see the ' **Open in iFont** ' or the same option for the font application you choose, click ' **More** ' and select ' **Copy to iFont** ' or any application you're using.

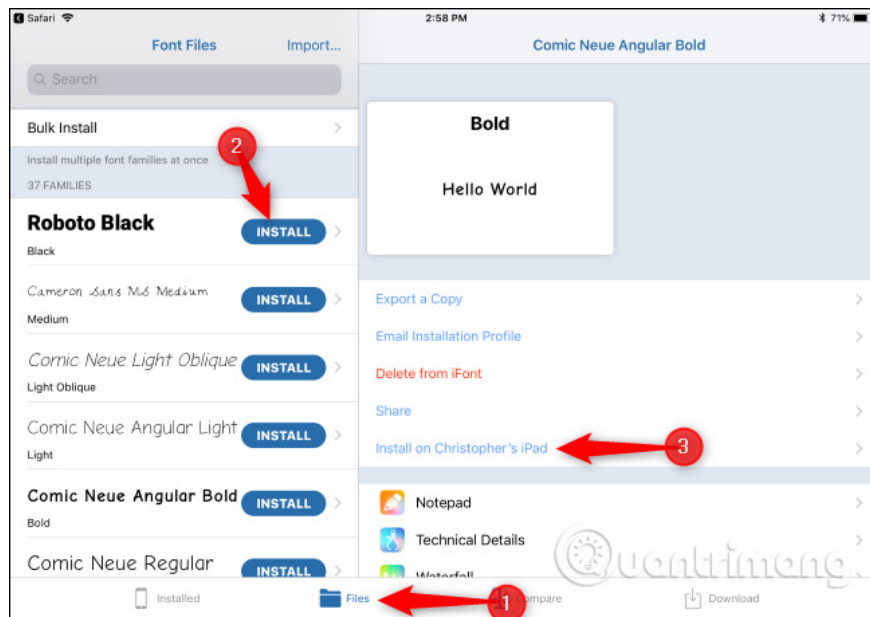

You will be prompted to enter the font from the downloaded file into your font application or you can save the fonts to a location like iCloud Drive and then import them from any font application you are using. .

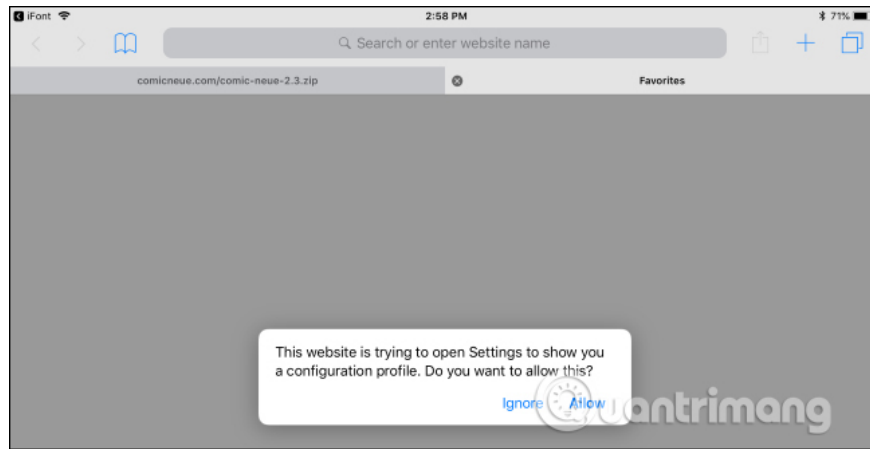

Step three: Install the font

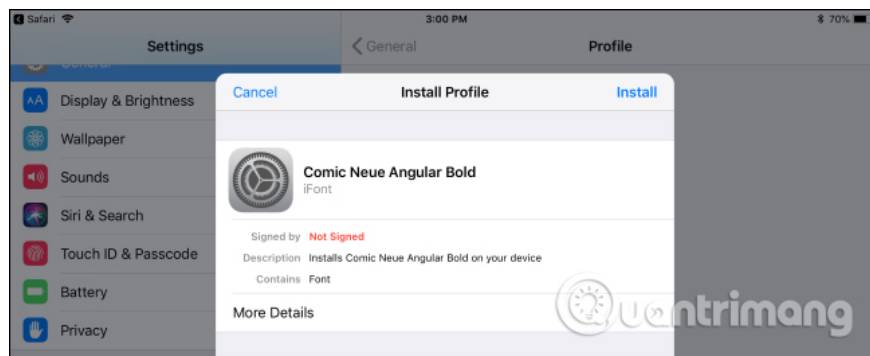

Any downloaded font has not been installed on the system. To install, find the installation option in the installation application. In iFont, tap the " **Files** " option at the bottom of the application to see a list of downloaded font files. To set the font, select it in the list and then tap the ' **Install on [Device name]** ' option. You can also select the ' **Bulk Install** ' option to install multiple fonts at once.

Click ' **Allow** ' when prompted to open the profile profile in the **Settings** application.

Press '**Install**' and enter the PIN code when prompted to install the selected fonts. You will be warned that the profile has not been signed with the key, because it is created on the device. Do you check if it's safe by touching **More Details** to know the exact profile, in this case the font you selected. Touch **Done** after setting up the profile.

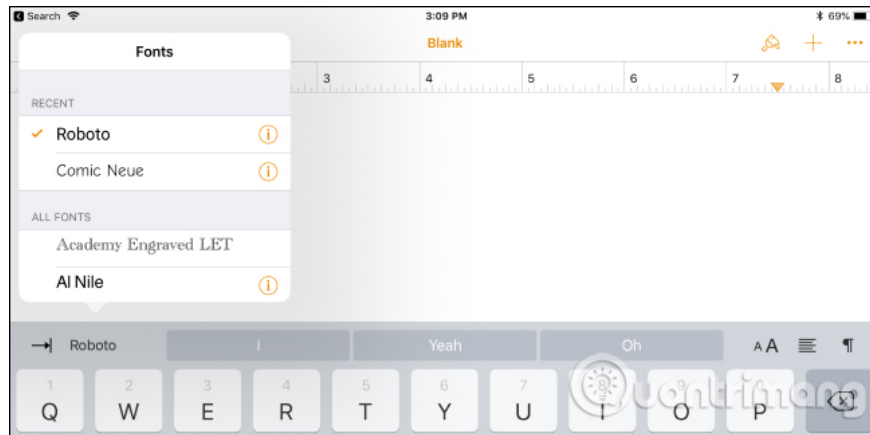

You should now see this font in all supported applications.

Step four: Use the font

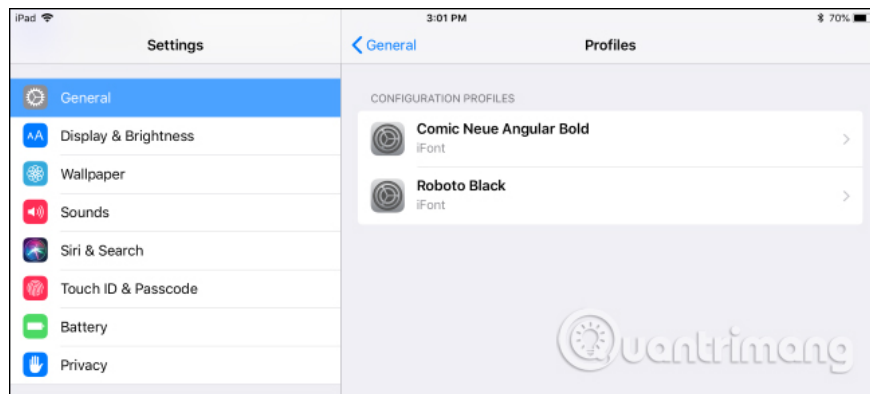

The installed fonts appear in the font menu in different applications with standard fonts. You don't have to do anything special to find them, just press any '**Fonts**' button on the app and select the installed fonts from the regular font list.

If the installed fonts do not appear in the application, ask the application developer to support the user-installed system font.

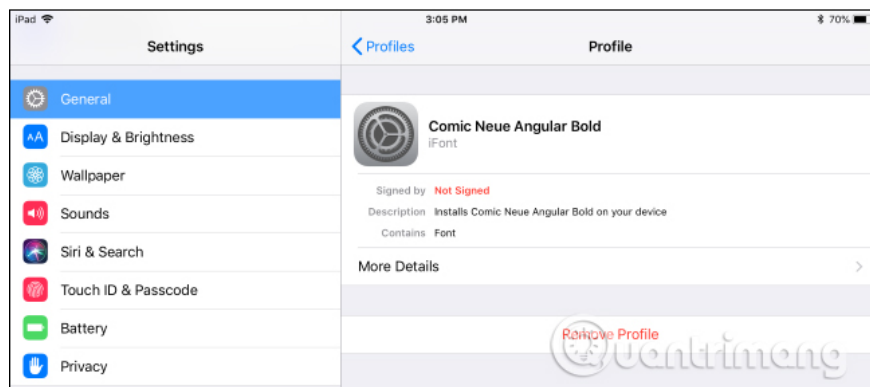

How to remove the installed font

You can see the list of installed fonts by going to **Settings**> **General**> **Profiles** . If you have multiple fonts installed at the same time, you will see a profile that contains many fonts. In case of installing each font, you will see many profiles, each containing a font. You can touch a profile and then touch **More Details** to see the font inside.

To delete a profile, tap it and then select "**Remove Profile**". This will delete the profile and the fonts contained in it.

Your iPad or iPhone may have other profiles that do not only contain fonts. For example, if the iPad or iPhone is issued by the company, there are many other profiles to use for business purposes, so you should be careful when deleting profiles.

I wish you all success!
