Note:

The device used in the article runs Android 7.0 operating system, for other Android devices may have to work a little differently to get into safe mode. So, if it is still not successful, you can refer to the Safe mode activation guide on Android to know how to do it.

Step 2:

Immediately the device will restart your Android phone, when this process ends you will see the word "Safe mode" at the bottom left of the screen. And to perform virus removal on Android, you need to access the *Settings* application (*Settings*) and then select the *Application (Application)* section.

Step 3:

At the list of applications that have been downloaded and installed on Android, you select the application that is infected with viruses, containing malicious code. For example, in the article select Opera VPN application.

Next, select the *Remove application* and click *OK* to confirm you want to uninstall this application.
