

How to kill Vlove virus

The Vietnamese Internet community is witnessing a new 'flood' from the internal virus called Vlove, spread through the most popular Yahoo Messenger instant messaging service today. Virus sends IM to the entire list friend

The Vietnamese Internet community is witnessing a new "flood" from the internal virus called Vlove , spread through the most popular Yahoo Messenger instant messaging service today. The virus sends an IM to the entire friends list, which the owner doesn't know about.

When receiving this message, the user absolutely does not click on the link, please ignore. In case of infection with this virus, follow these steps:

1. Download the necessary tools:

- Download Hijackthis software to manage programs started with Windows.
- Load Killbox software to delete files that windows does not allow.

2. Back up the registry

Because the following removal method is mainly related to the Registry and Hijackthis is one of the software that strongly affects this function, you need to back up (save) before attempting to prevent the problem later. Back up the registry by:

- From *Start* -> *Run* -> type *regedit* command -> *File* (in the *Registry Editor* window) -> *Explorer* -> save the exported file as you like.
- When something goes wrong with the *Registry* , you just need to re-enter (*Import*) the original file is ok.

3. Run Hijackthis:

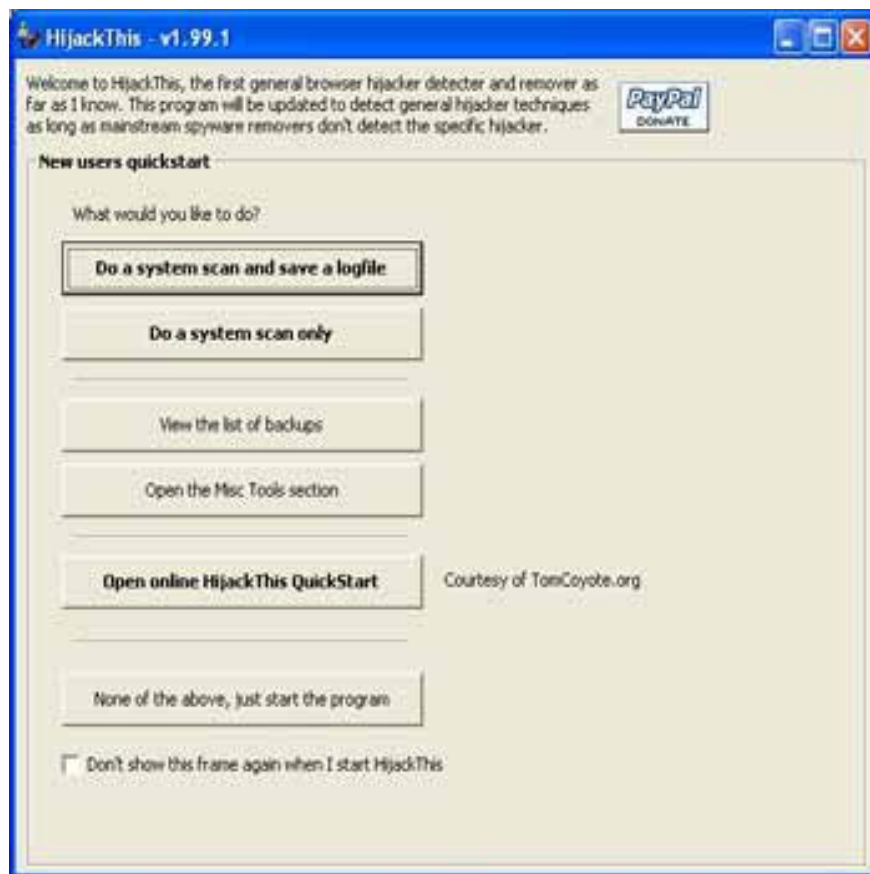

Figure 1

Click "*Do a system scan and save a logfile*" (*Figure 1*)

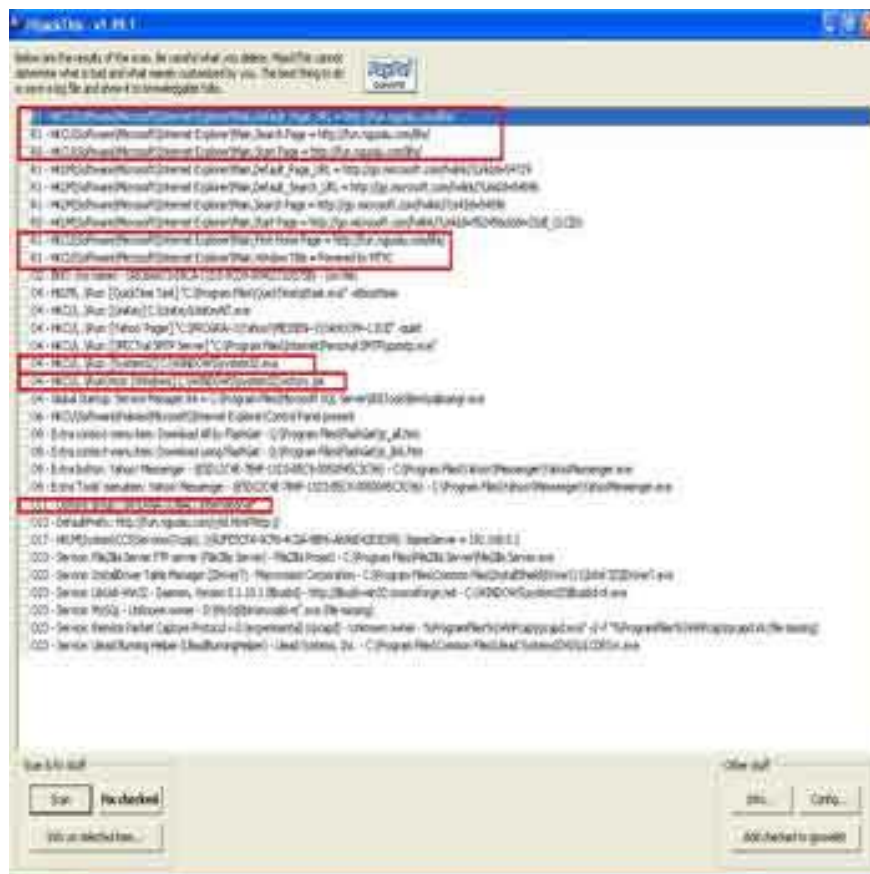

Figure 2

The areas that are highlighted in red (Figure 2) are the viruses created by the virus. Please check all the keys then check the checked to remove them. (Figure 3).

You find and click on the following keys:
