

How to Make a Gradient in MS Paint

Think only fancy programs like GIMP and Photoshop can make gradient? Well, think again! With a bit of messing around, Paint can give gradient just as good! Using the line tool, draw a diagonal line across the page

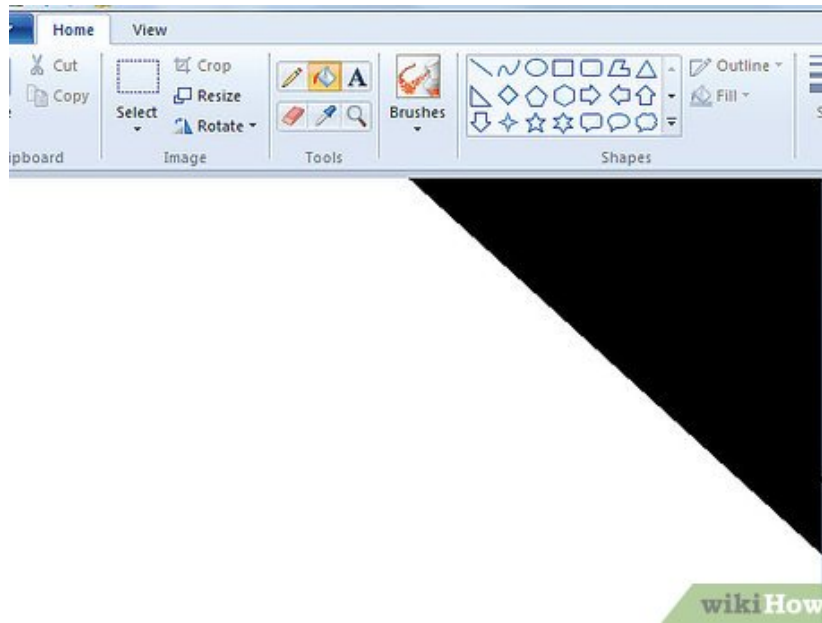

Method 1 of 2:

Using "Resize and Skew"

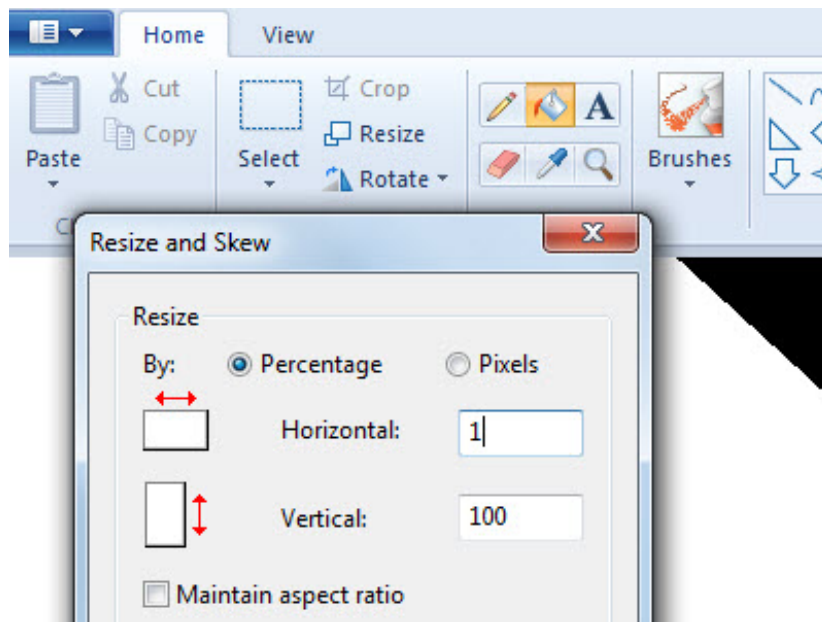

1.

Using the line tool, draw a diagonal line across the page

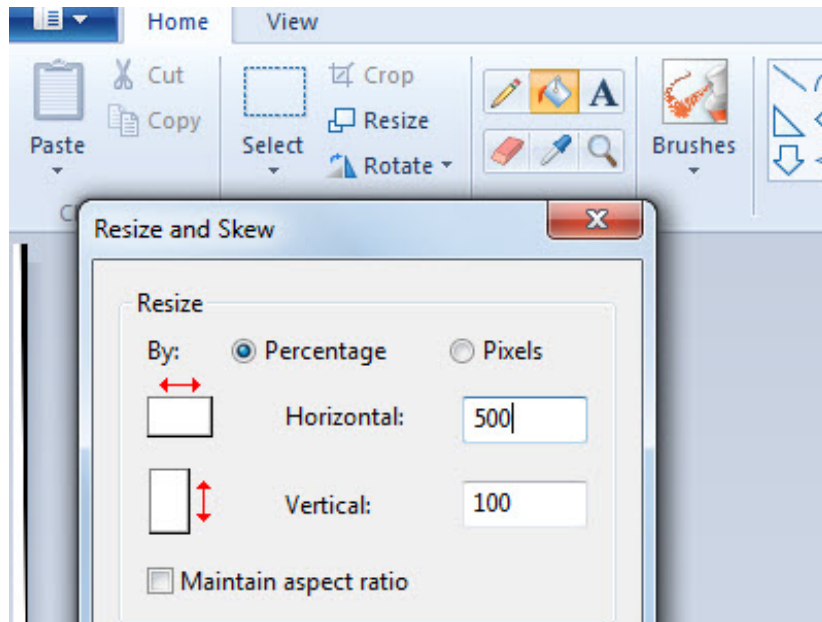

2.

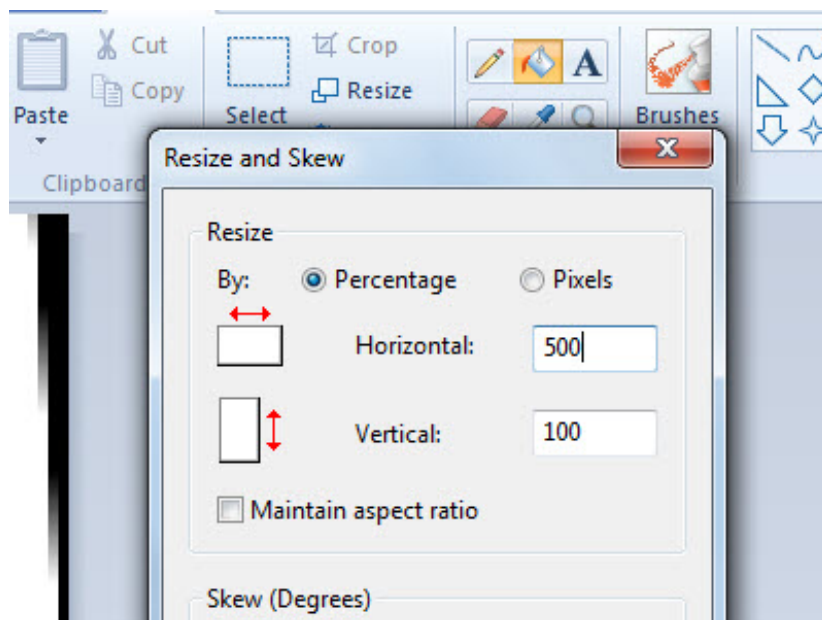

- Fill one side in with the paint bucket. The color can be any that you want, but in this case, black is used.**
3. **Click on "Resize" and change the "Horizontal" value to "1"**

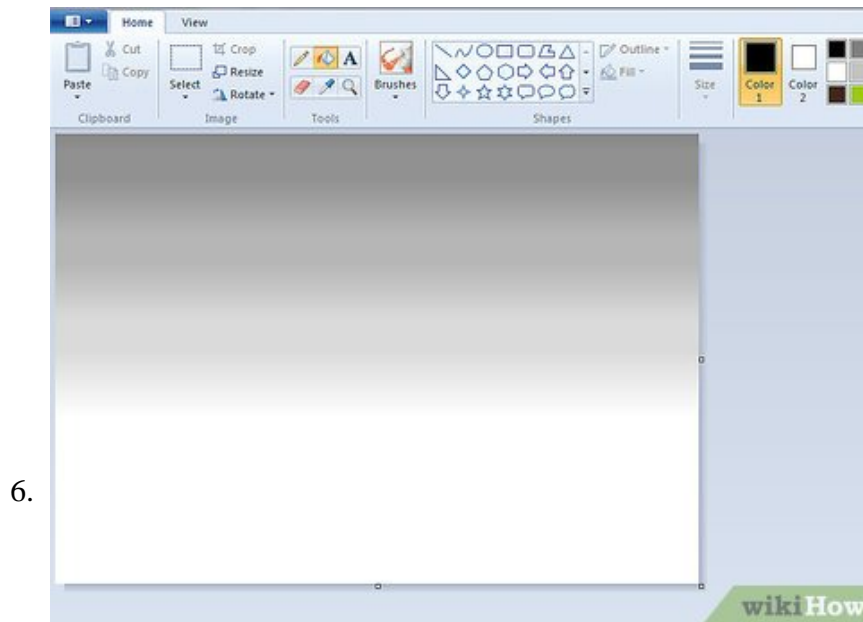

4. **When you have finished that, go to resize skew again, and this time switch horizontal to 500**

5. Repeat steps 3&4 one more time and execute step 4 for a couple of times to have a better result

Now you have your gradient!

Method 2 of 2:

Editing Colors Manually

1. **You can also manually edit colors to create gradients.** To do this, start with one color.
2. **With that color selected, go to "Edit Colors" and change the color slightly.** Make sure it's different enough that you can see it, but not so different that it will look choppy.
3. **Add that new color next to the original color.**
4. **Repeat the process multiple times.** If you are making a blue-purple gradient, for example, start with blue and make it gradually more purple.
5. **Have patience!** This method takes a really long time, but it also allows you to blend the gradient in any direction. It will be worth it.
