

There are many ways to measure network speed on laptops. But the simplest, easiest, most agile way is to visit <https://www.speedtest.net>. Just one click, the system will automatically check the network you are using. Please wait for results for about 1 minute. Speedtest is one of the most trusted and trusted free and reliable network speed testing service. Speedtest also has apps on phone devices.

SpeedTest's interface is very user-friendly and easy to understand, returns results fast and is completely free

## How to read parameters of network speed test

Whichever method you use, most tools will measure and produce results for three factors:

### 1. Ping rate

The ping rate is displayed first, measuring the network latency. Understandably, the higher the ping parameter, the easier the machine and network lag. On average, the battery speed below 20 ms is considered good. If you often play games, you need to pay attention to this parameter.

### 1. Download speed

Download speed is considered to be the most important parameter when measuring internet speed. The faster the download speed, the faster the network, the smoother experience. When checking, we also use this number to compare whether the network package provided by the provider is exactly as in the contract.

Do not pay more than the internet plan you receive from the network

### 1. Upload speed

Upload or upload speed is the speed for us to upload data to the network, in contrast to the above specification. Usually the upload speed is always lower than the download. For those who need to download data (as a streamer), this parameter is also needed to pay attention.

## What should I do if I measure the internet speed?

After measuring the speed and find the parameter is lower than the number that the network operator committed, do not hesitate to contact them for explanation. However, the network is not always slow because of the operator's fault. Whether your internet speed and experience is smooth or not can be affected by:

1. Ability to capture the network of the device, namely a laptop
2. Network systems are experiencing common problems, such as broken fiber optic cable at sea
3. Use the network during peak hours
4. Your network equipment is bad or problematic

There are many other reasons for the network to be slow, not just the network

How to measure network speed on laptops as above instructions is very simple. So there's no reason you shouldn't check it often. Testing the network to compare with the package you pay to buy is protecting your own basic customer benefits.
