

How to preview images where needed on Google Maps

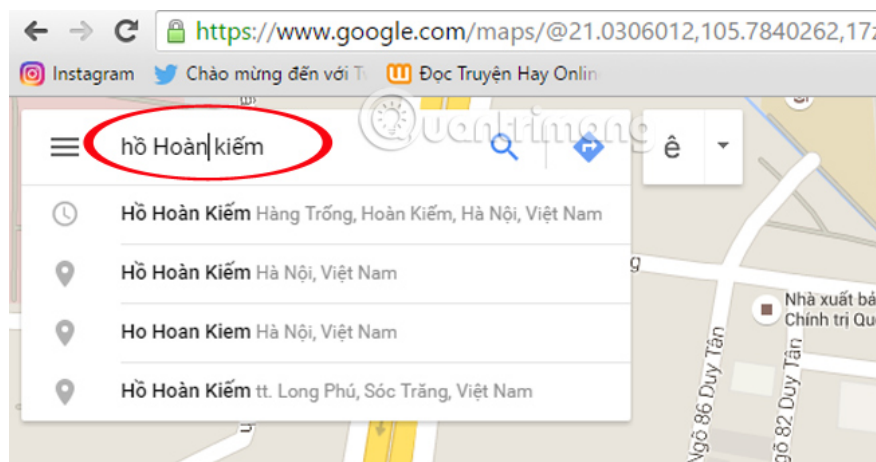

As one of the most popular online mapping applications today, Google Maps provides convenience for users when you can search for locations and locations much faster. And we can observe the destination on Google Maps by ...

Being rated as the most useful online map application today, Google Maps is increasingly asserting its popularity when giving users the ability to search for locations and locations quickly. Even with every device, every location you can find a convenient destination and direction is based on the suggestion of Google Maps.

Besides, the preview of the destination is possible when using this map application. This will make it easy to visualize where to look, and it will be easy to reach that location. If you do not know how to use this feature, you can follow the tutorial below of Network Administrator.

Step 1:

First, go to the Google Maps app homepage and log in to your personal Google account. At the main interface of the application, you need to **enter the name of the destination you want into the search box** . A list of results appears, click the correct search results.

Step 2:

Soon a map will appear for the area we search for. And the place to look will be marked with special marks. At the map interface, scroll down and **click the image icon Show image** .

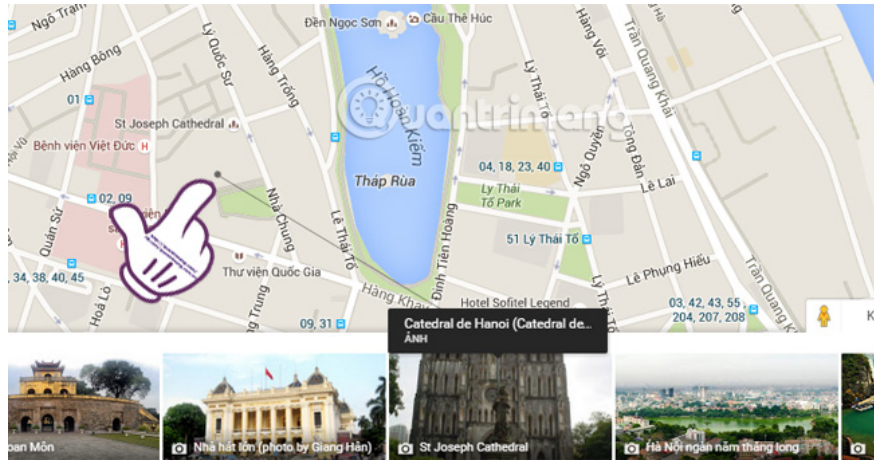

Step 3:

Soon, a series of images of the location will appear with different shooting angles, appearing below the map. Besides, you will also see pictures of famous places around that area.

Step 4:

Google Maps also allows us to **query backwards from the images provided below** . If you want to know the location of a point, just hover over the image and see the line connecting the image to the place of the place.

Step 5:

When you click on the image, we will be able to see the whole place with the enlarged, sharp and clear image. On the left is the name of the photographer and the time.

The application also allows us to view photos with 360 degrees. However, only a thumbnail image has a **rotating icon** that can be viewed in 360 mode.

As soon as we click on the 360-degree panorama, we can rotate every direction when clicking on **the compass icon** or use **Ctrl + drag** to view the panoramic 3D image.

With this useful feature of Google Maps, you won't worry about getting lost and not finding the location you need to find. Hope you can take advantage of the unique features of Google Maps when searching for places.
