

# How to quickly send links from Android phones to Windows PCs

While phones are handy, they don't offer the same comprehensive experience for doing everything as PCs. Sharing a link to a Windows computer helps users instantly access the content they want to watch, without having to perform complicated copying operations.

In this article, let's learn how to quickly and easily send links from Android phones to Windows computers.

## How to send URL from Android to Windows

To share a link from an Android phone to a Windows PC, users need to link both devices first. But before you start, make sure your phone is running Android 7.0 (Nougat) or later and your Windows PC has at least the Windows 10/05/2019 update.

So first, update your device if necessary. Also, the phone and PC must be connected to the same Wi-Fi for this method to work. Follow these steps to set up your Windows phone and PC to be ready to share the link:

**Step 1** : Download and install Your Phone app on Windows PC.

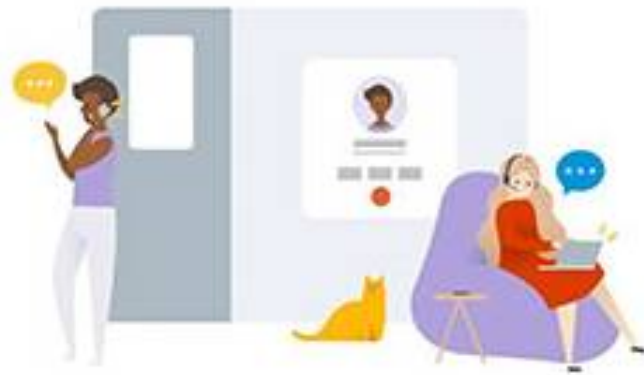

**Step 2** : Launch the application, select **Get Started** and log in with your Microsoft account or create a new account if you do not have one. The app will take people to the screen to pair with the Android phone.

**Step 3** : Select the checkbox next to **I have the Your Phone Companion - Link to Windows** . Click Pair with QR code. The app will generate a unique QR code.

**Step 4** : Next, install Microsoft's Your Phone app from the Google Play Store on your Android phone. Launch the app and tap on **Link your phone and PC** .

**Step 5** : Click **Continue** and put the QR code scanner displayed by the application on the PC.

**Step 6** : After scanning, tap **Continue** on the device and grant the app all necessary permissions. People should also allow apps to run in the background. Tap **Done** to finish on your phone. On PC, click **Continue** to finish.

Make and take calls from your PC

The link will open immediately in the default browser if the PC is on. Otherwise, the user will be notified when the PC is turned on.

Sharing a link from one of the devices is not a difficult job. The process is simple for Android and Windows PCs with the link opened directly in the default browser.
