

How to Safari save passwords on iOS devices

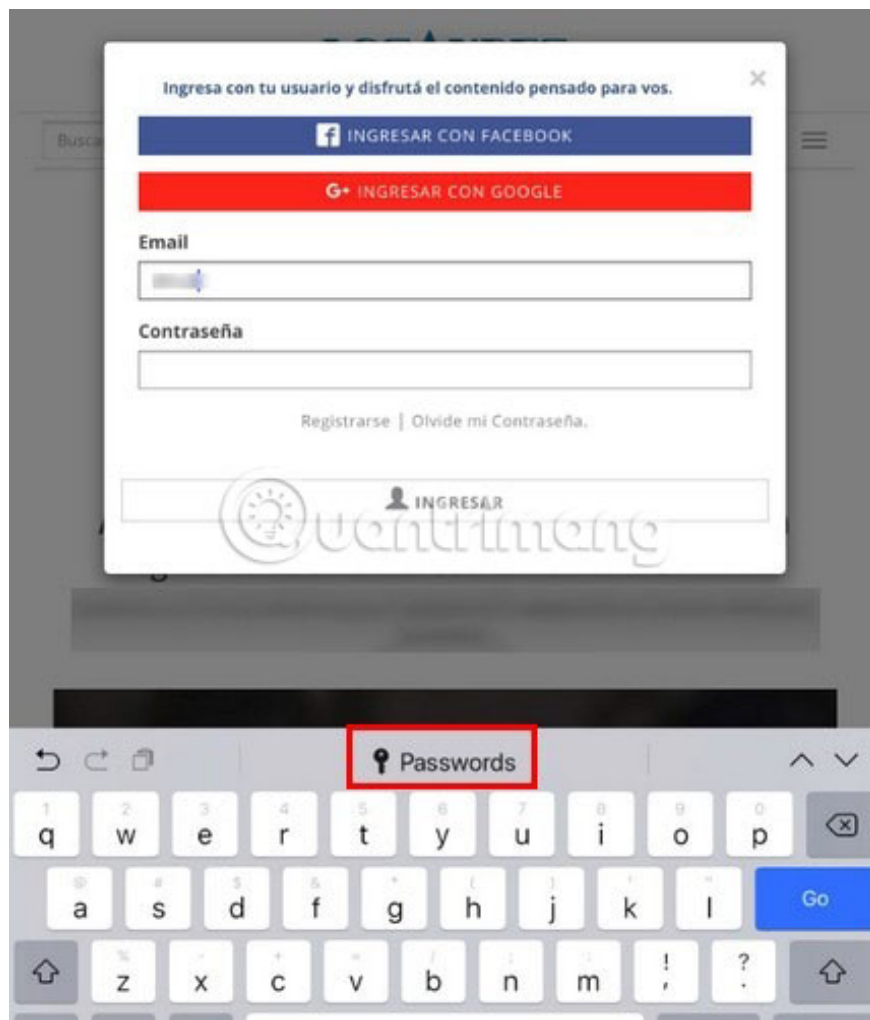

Security experts always remind you to set a strong password for your account. The only problem is that remembering strong passwords for multiple accounts is almost an impossible task.

Security experts always remind you to set a strong password for your account. The only problem is that remembering strong passwords for multiple accounts is almost an impossible task. So where should you save your password at the end?

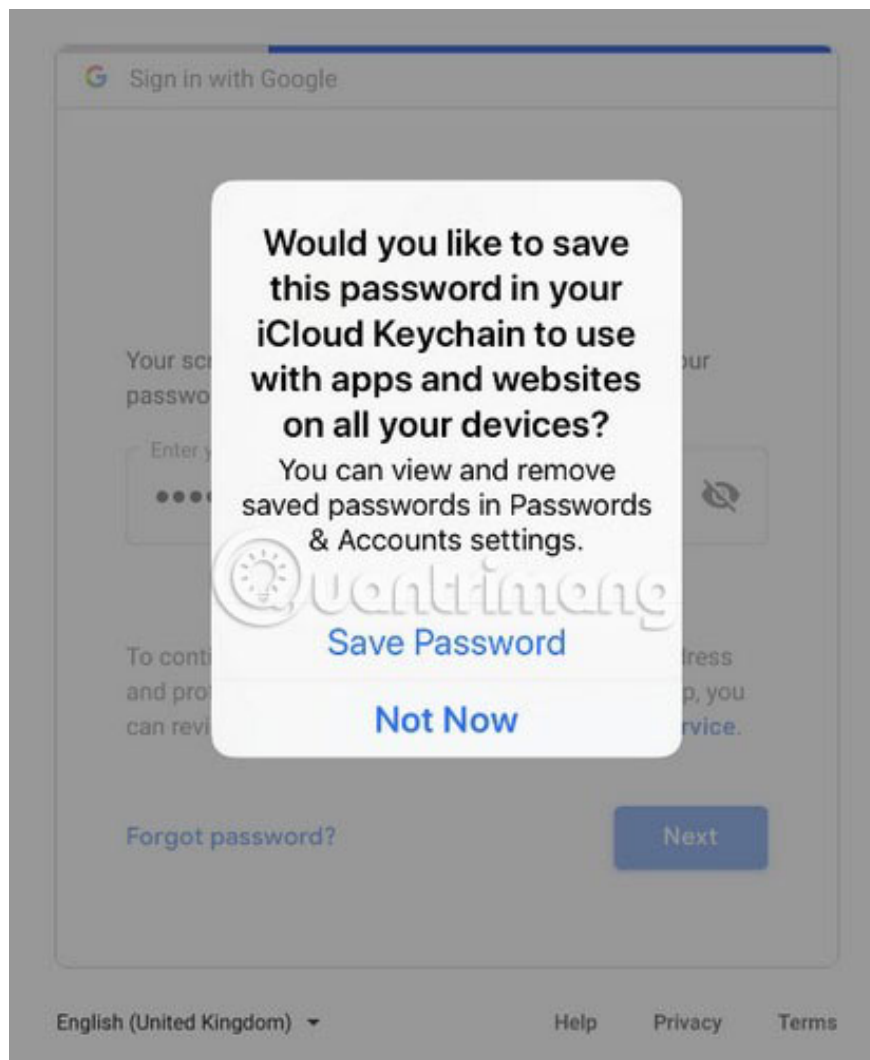

The answer to this problem is still controversial, but if you decide to keep your password in the Safari browser, the following tutorial will show you how to do it, the next time you need to log in. into the account, you will not have to depend on the application to save the password of the third party anymore.

How to allow Safari to save your password

The simplest method you can try for Safari to save your password is to allow iOS to do it naturally. Visit the website with the login information you want Safari to save. Log in to the website as usual and before you click the login button on the website, your keyboard will display the **Passwords** option .

If you have never logged in to that particular website before, just add your username and password as usual. After logging in, a dialog box will appear, asking if you want to save the **iCloud Keychain** login information for the next time.

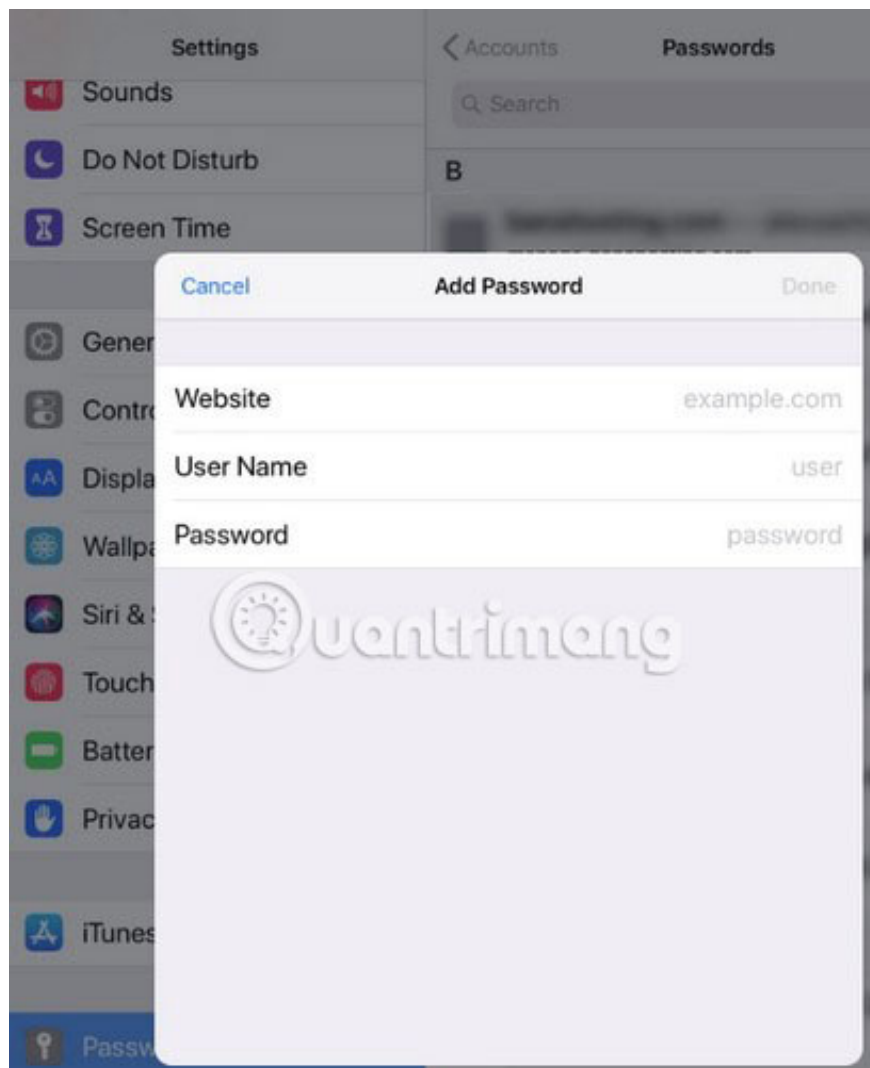

If you click on '**Save Password**', the password will be saved and the next time you visit the website, simply click the '**Passwords**' option. Login information will automatically be filled out. If you have multiple login information for the same site, you will see two of the options below. Click on the option you want to use. If there is an option not already displayed, click on the '**Passwords**' link to find the correct password in the saved login list.

If you ever change your password on the website, you will be asked if you want to update your password.

If you want to start saving passwords for frequently visited websites, you will need to dig into the **Settings** section of the device. On the left panel (in **Settings**), swipe down until you see the '**Passwords and Accounts**' option.

Touch this option, followed by '**Website and App Passwords**'. You will see a plus sign at the top. Touch it and fill in the information you want to save. Check if there are any errors and click **Done**.

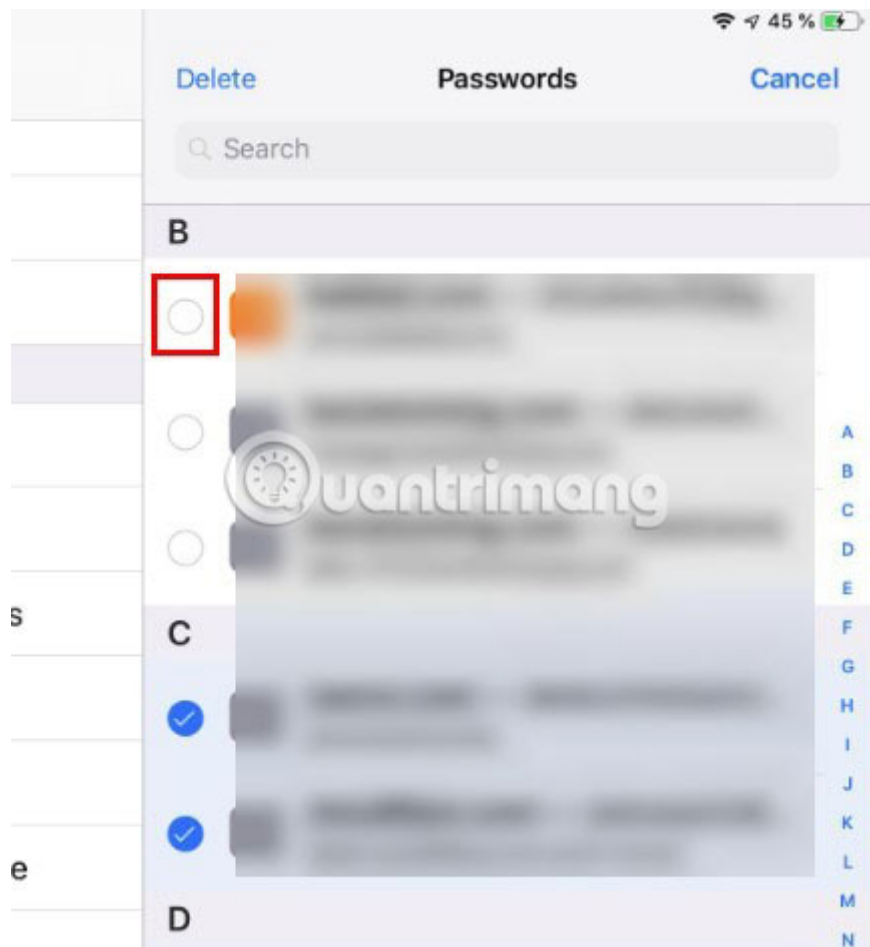

Passwords are used and saved not only in Safari, but also in other browsers and other applications. That means data is saved for both web applications and applications such as Dropbox. If you log in to the Dropbox web application and save the login information in Safari or another browser, then open the Dropbox application at a different time, it can use the same login information stored.

How to prevent Safari from filling in the password

Suppose you want to keep your password, login email and username on Safari (Safari saves all three of these information), but you don't want the browser to automatically fill them. To turn off auto-fill, go to **Settings** and select '**Passwords and Accounts**' .

Under **Website and App Passwords** is the option to turn off the auto-fill password feature. As long as this feature is disabled, you can still keep the password, but Safari will not automatically enter the password.

If you want to delete any password, click the **Website and App Passwords** option and select **Edit** at the top right.

All passwords will have a circle on the left. Select the password you want to delete and click the **Delete** option at the top left. You can also delete a specific password by clicking on it. After clicking on the editing option, a red circle will appear. Touch this red circle to delete login information for that site.

Currently, there are so many things to remember and you can use some help tools. If you can trust Safari, it is always ready to help.

Hope you are successful.
