How to separate sound from video on PC

Step 1: Download Camtasia Studio software here:

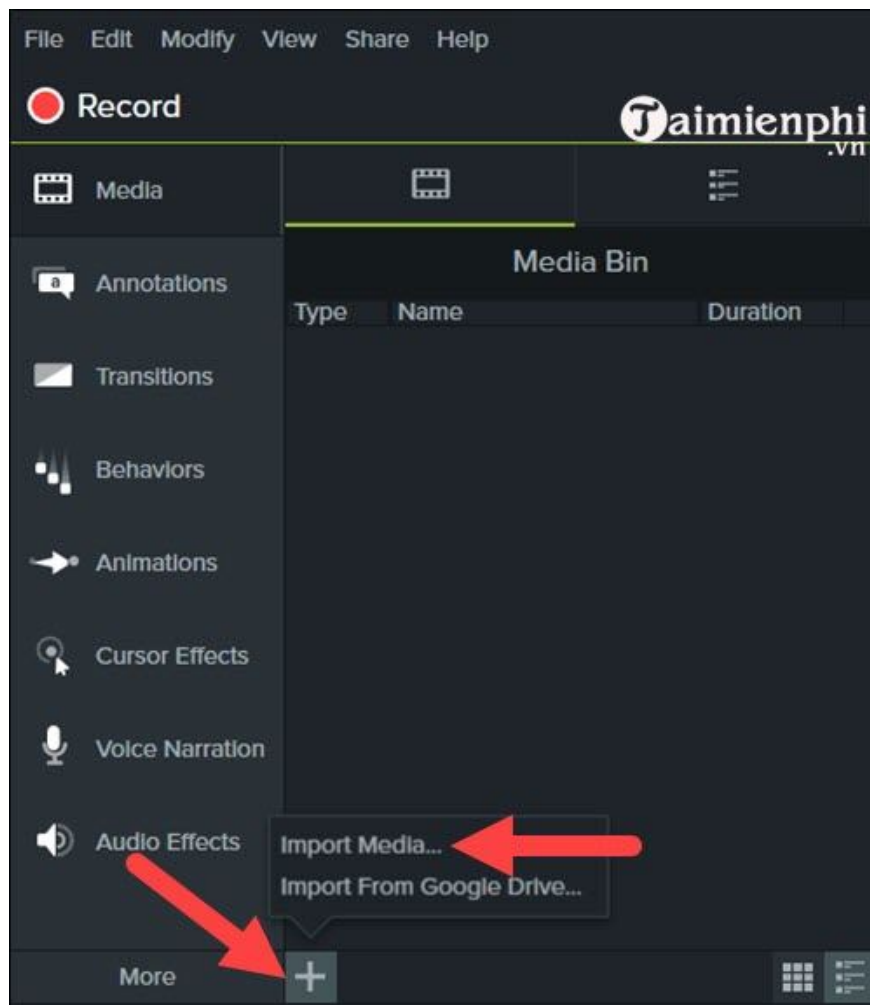

=> Download link

>> See instructions **for installing Camtasia Studio** for your computer here if you don't know how to install.

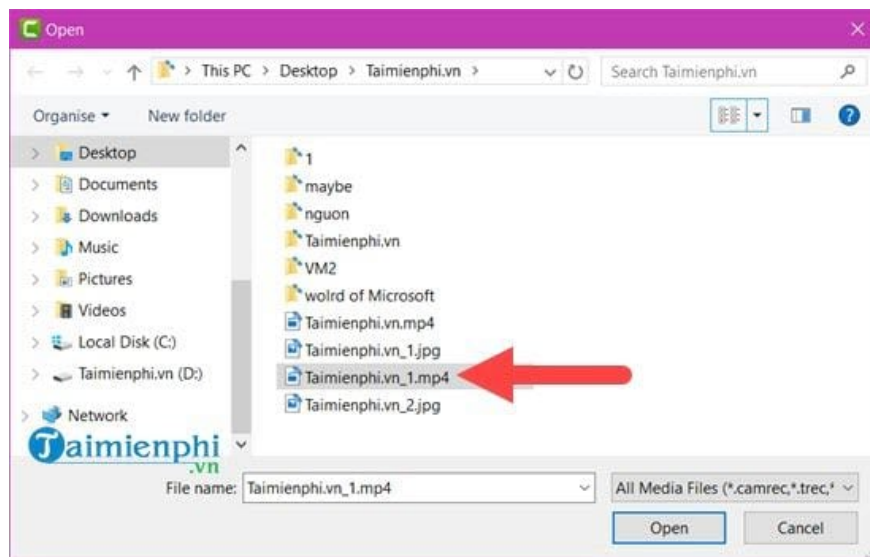

After installing Camtasia Studio, we open the Camtasia Studio software, this is its basic working interface.

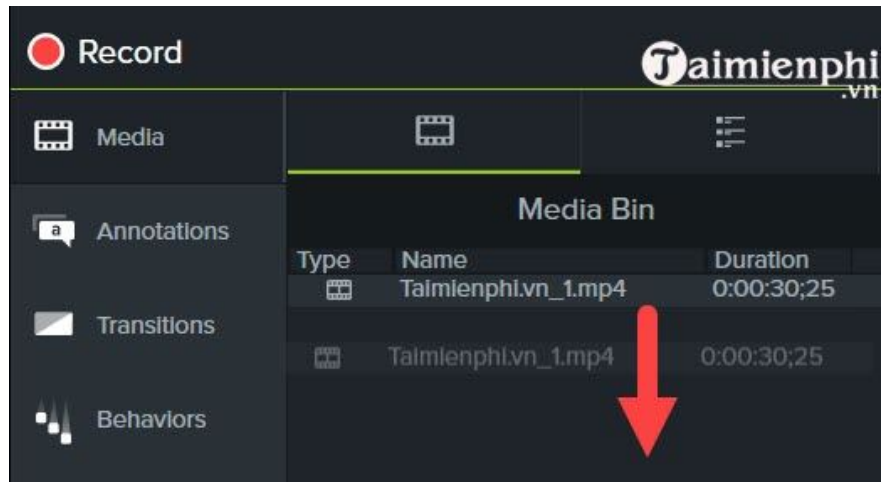

Step 2: Here, pay attention to the interface on the left, click on **the plus icon** > select **Import Media** in the Media section to proceed to load the video that needs to be separated from the audio to capture the image into Camtasia Studio.

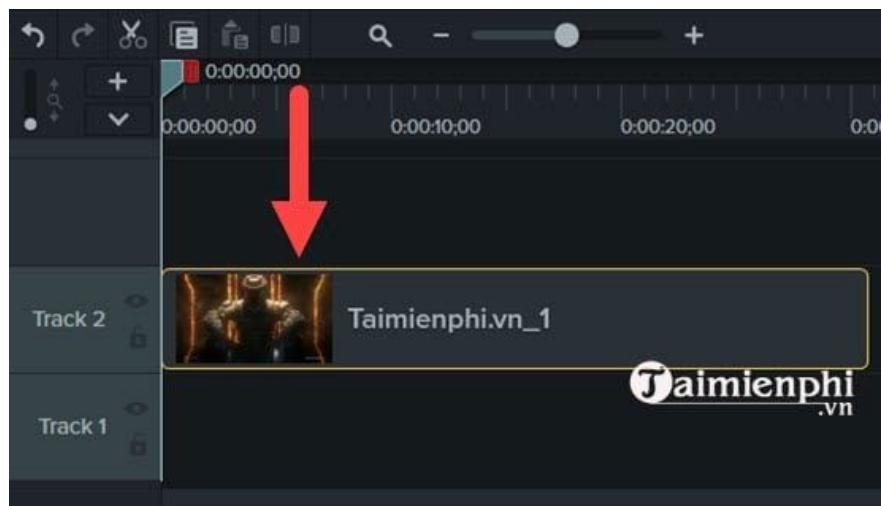

Step 3: Select the video you want to separate the sound for and click **Open** .

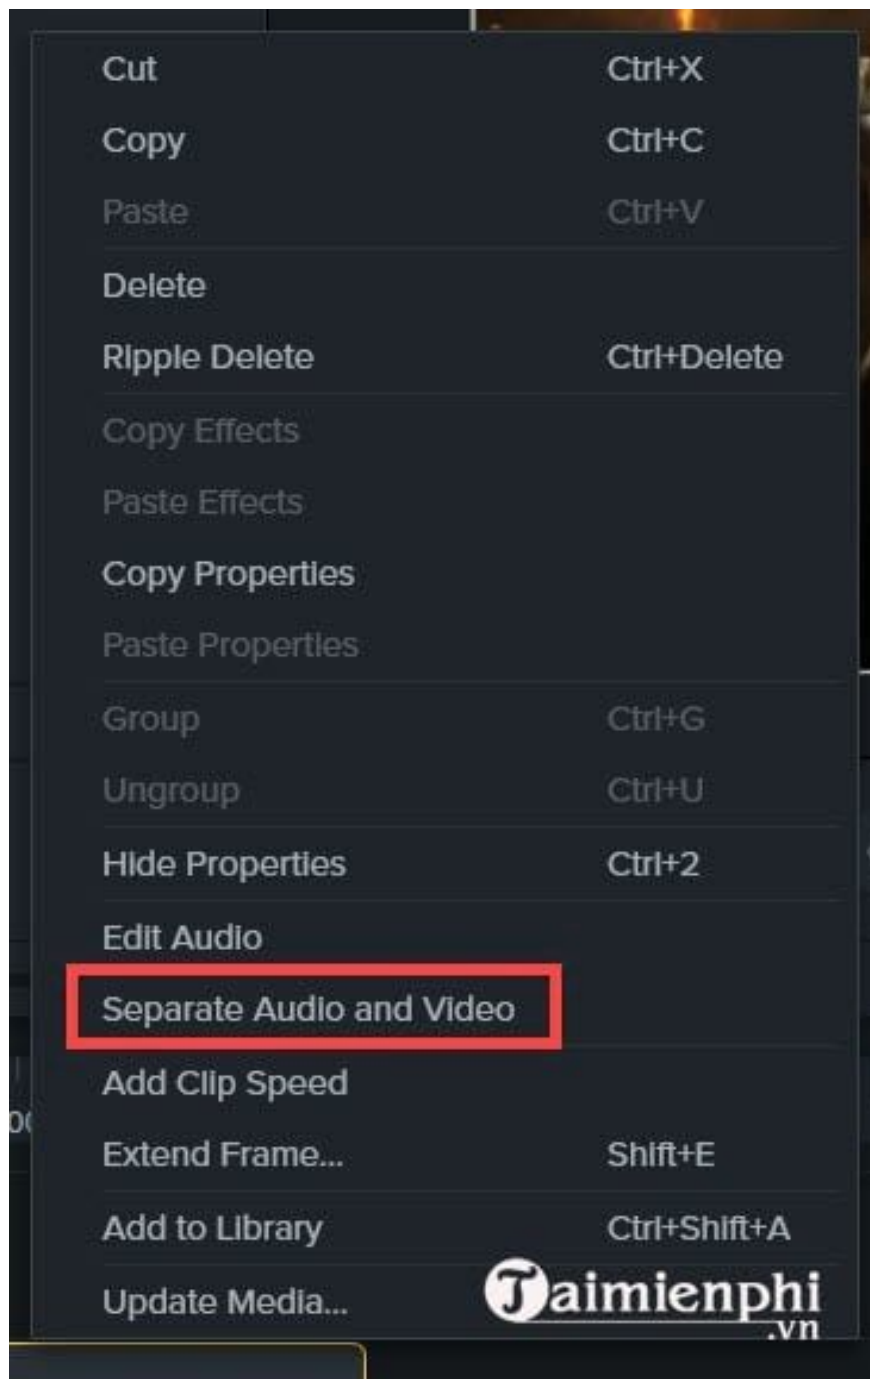

Step 4: Once the video is added in Camtasia Studio, long **press on the video** and **drag and drop it to the working layer** below.

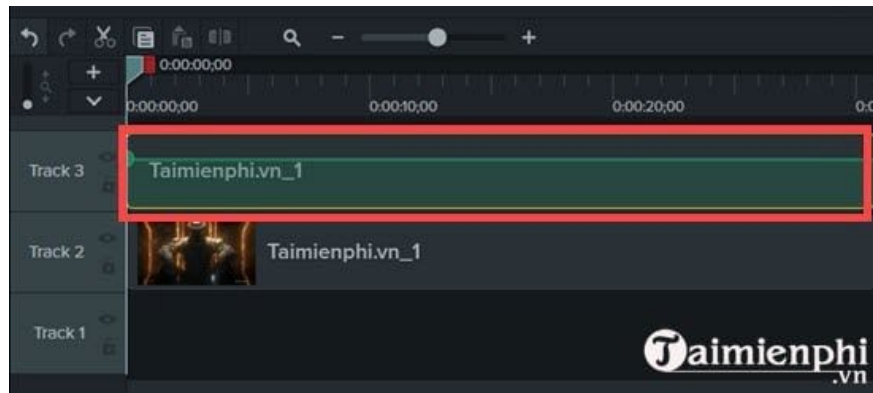

You will see the video layer appear below and we will proceed to separate the audio from the video here.

Step 5: To separate the audio from the video, just **right-click** on that layer > select **Seperate audio and video** .

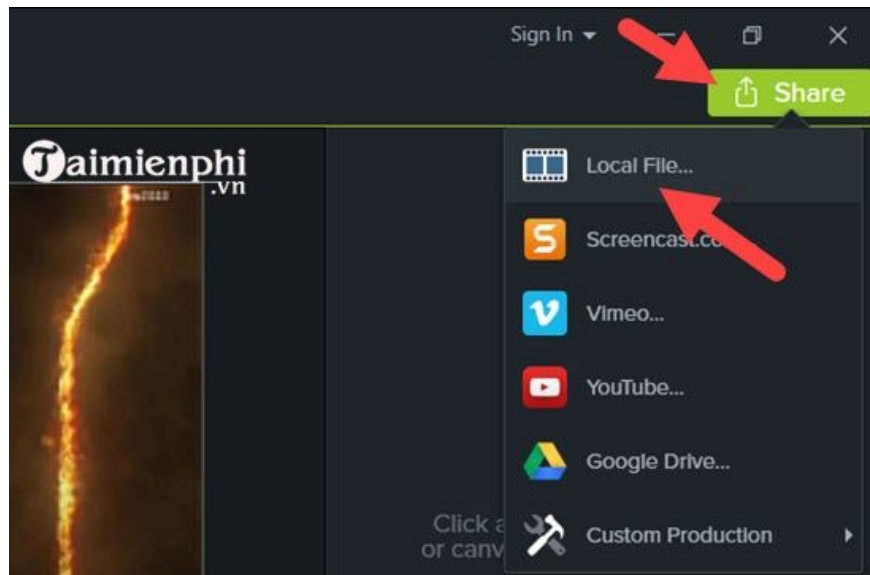

Step 6: You will immediately see your original layer divided into 2 parts with the upper part being the sound and the lower part being the image. **Right-click** on the audio section.

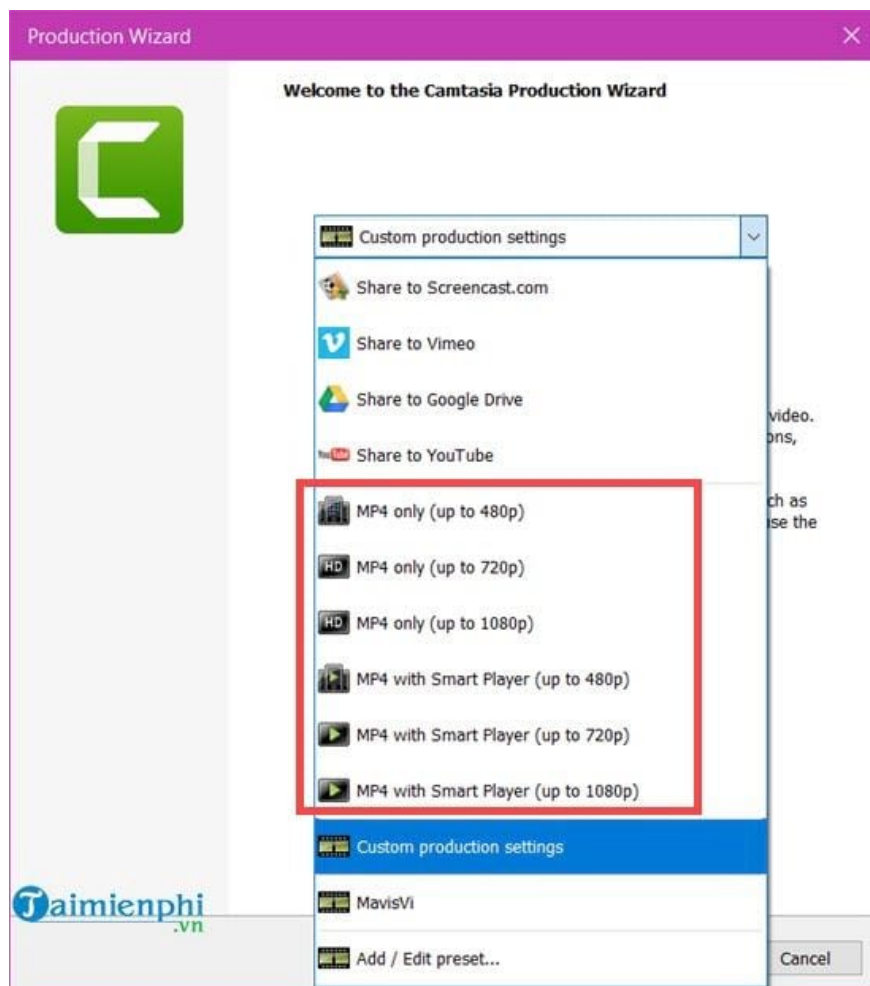

Here you select **Delete** to delete the audio of this video.

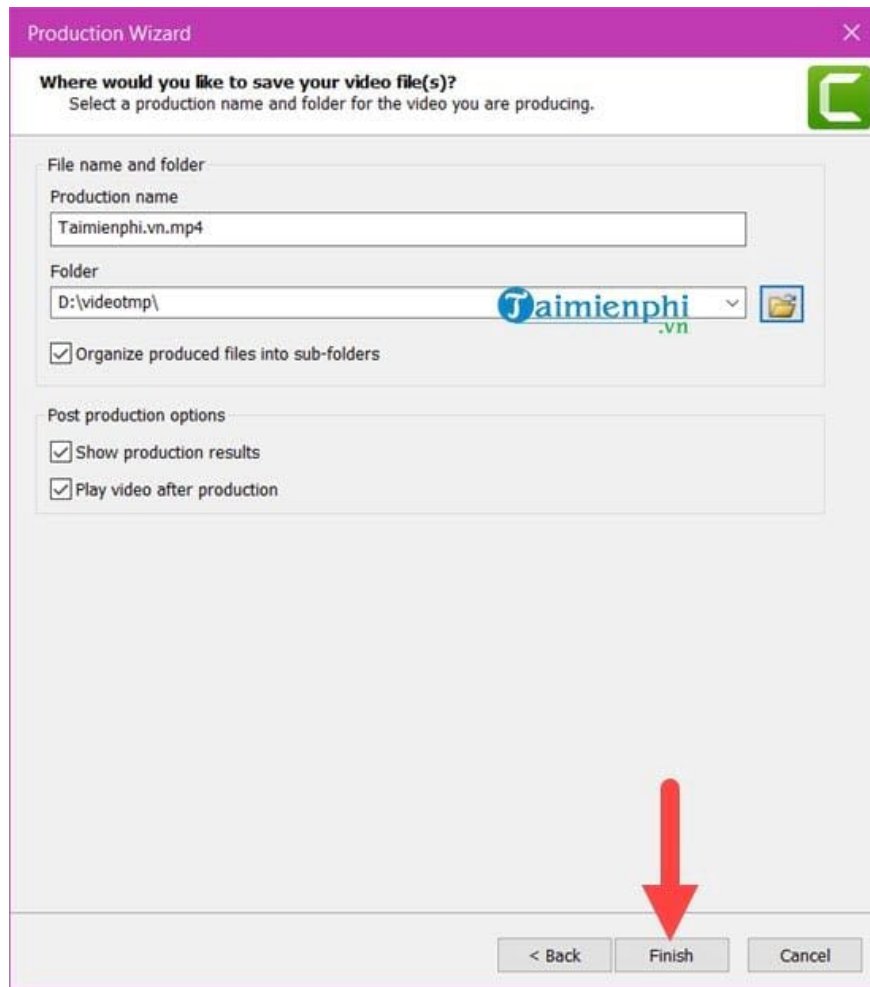

Step 7: After deleting, separating the sound from the video is almost complete and the last step we have to do is export the video. Look at the right corner of **Camtasia Studio** > click **Share** then select **Local File**.

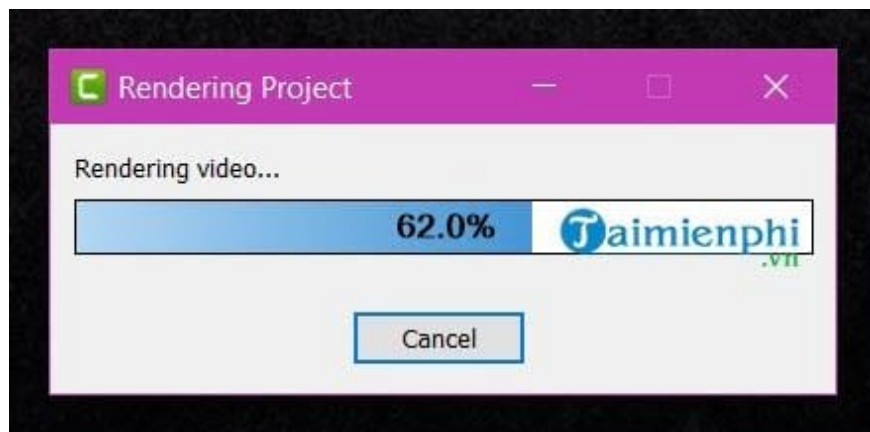

Step 8: Here is the resolution option, it is best to choose the original resolution for the video where you separate the sound from the video.

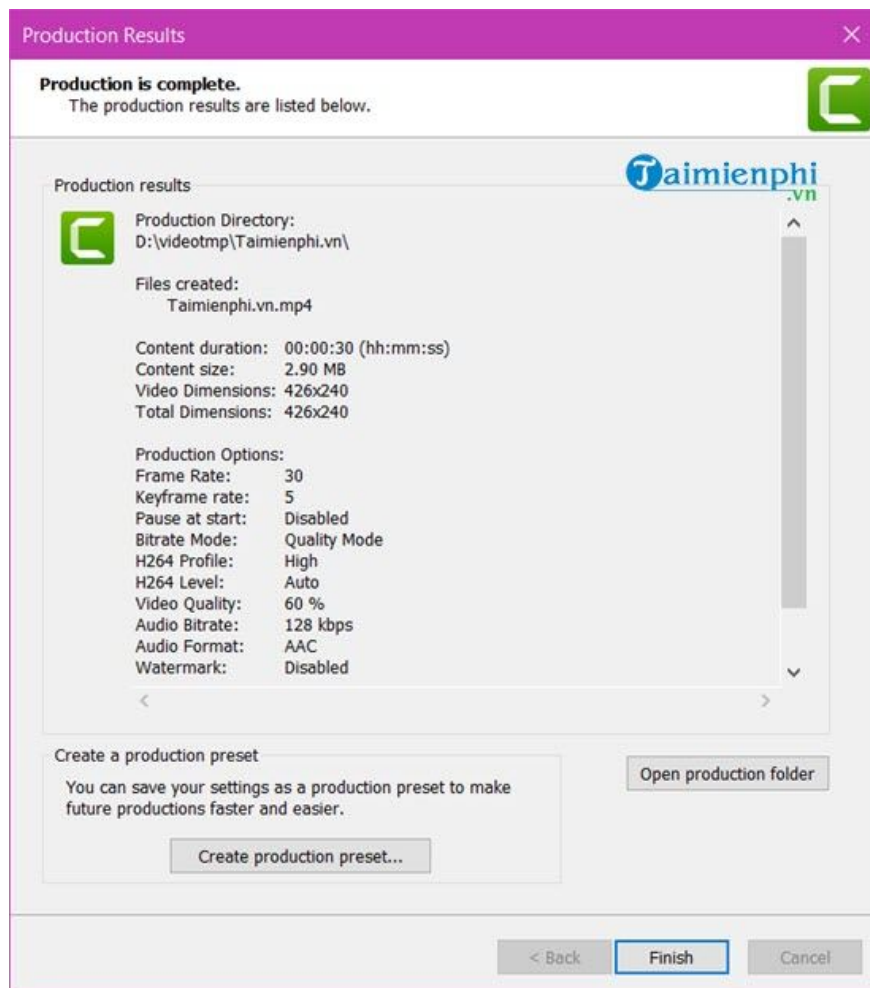

Step 9: Name and enter the path to save the video and click **Finish** to proceed with Render.

How fast or slow the Render process is completely depends on your video and also depends on your computer configuration.

Step 10: When the video is completed, you will be notified with a link, and will also open the video so readers can rest assured.
