

How to set up Wireguard VPN on Linux

Wireguard is a powerful open source virtual private network (VPN) daemon that can run on both desktop and mobile devices.

It offers a fast and lightweight alternative to traditional VPNs like IPsec and OpenVPN. Today's article will show you how to install Wireguard and create a simple VPN setup using 3 Linux machines.

Download Wireguard

The first step to setting up Wireguard on Linux is to download its core tools from the distribution's repository. This allows you to control the built-in Wireguard kernel module using userspace commands.

To install core tools in Ubuntu and Debian, run the following command:

```
sudo apt install wireguard wireguard-tools
```

In Fedora you can use the dnf package manager:

```
sudo dnf install wireguard-tools
```

For Arch Linux, you can run pacman to load Wireguard's core tools:

```
sudo pacman -S wireguard-tools
```

Confirm that you have correctly installed the Wireguard tools by loading its help screen:

```
wg -h
```

```
root@wireguard:~# wg -h
Usage: wg <cmd> [<args>]

Available subcommands:
  show: Shows the current configuration and device information
  showconf: Shows the current configuration of a given WireGuard interface, for use with 'setconf'
  set: Change the current configuration, add peers, remove peers, or change peers
  setconf: Applies a configuration file to a WireGuard interface
  addconf: Appends a configuration file to a WireGuard interface
  synconf: Synchronizes a configuration file to a WireGuard interface
  genkey: Generates a new private key and writes it to stdout
  genpsk: Generates a new preshared key and writes it to stdout
  pubkey: Reads a private key from stdin and writes a public key to stdout
You may pass '--help' to any of these subcommands to view usage.
root@wireguard:~#
```

Set up Wireguard server

Assumptions : This article assumes that you are installing the Wireguard server on a Linux system with a publicly accessible IPv4 address. The instructions will still work on the server behind a NAT, but it will not find nodes outside of its subnet.

With the Wireguard core toolkit on your Linux machine, you can now set up a VPN server node. This node will act as the Internet gateway for client nodes in the network.

Start by navigating to the Wireguard configuration folder and setting its default permissions to "root only":

```
cd /etc/wireguard sudo umask 077
```

Note : Some systems may prevent you from accessing the "/etc/wireguard" directory as a regular user. To fix that, switch to the root user with **sudo -s** .

Create public and private keys for Wireguard server:

```
sudo sh -c 'wg genkey | tee /etc/wireguard/server-private-key | wg pubkey > /etc/wireguard/server-public-key'
```

Create a server configuration file using your favorite text editor:

```
sudo nano /etc/wireguard/wg0.conf
```

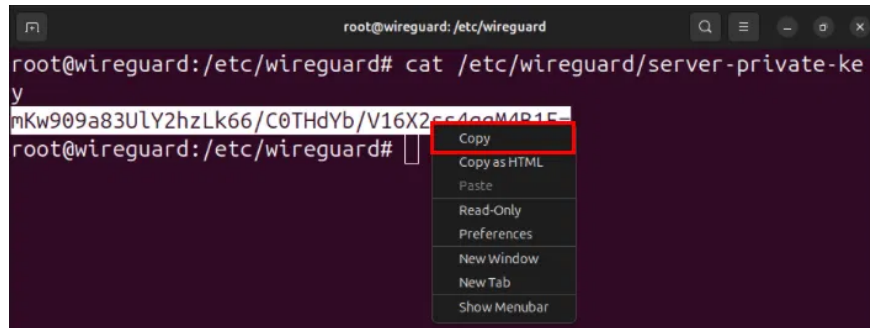

Paste the following code block into the server configuration file:

```
[Interface] PrivateKey = PASTE-YOUR-SERVER-PRIVATE-KEY-HERE Address = 10.0.0.1/30
```

Open a new terminal session, then print the server's Wireguard private key:

```
sudo cat /etc/wireguard/server-private-key
```

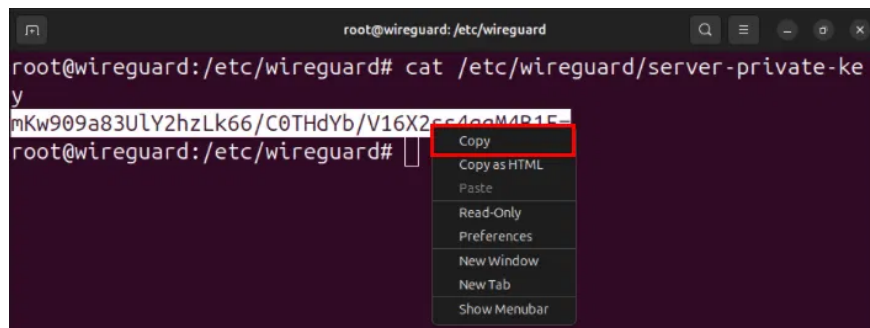

Copy the server's private key to the clipboard.

```
root@wireguard:/etc/wireguard# cat /etc/wireguard/server-private-key
mKw909a83Uly2hzLk66/C0THdYb/V16X2ss4ggM4B1E=
root@wireguard:/etc/wireguard#
```

A terminal window showing the command `cat /etc/wireguard/server-private-key` and its output. A context menu is open over the output, with the `Copy` option highlighted.

Replace the value of the **PrivateKey** variable with the key on the clipboard.

```
root@wireguard:/etc/wireguard# cat /etc/wireguard/server-private-key
mKw909a83Uly2hzLk66/C0THdYb/V16X2ss4ggM4B1E=
root@wireguard:/etc/wireguard#
```

A terminal window showing the command `cat /etc/wireguard/server-private-key` and its output. A context menu is open over the output, with the `Copy` option highlighted.

Find the network interface that has Internet access using the `ip` command:

```
ip route get 8.8.8.8
```

```
root@wireguard:/etc/wireguard# ip route get 8.8.8.8
8.8.8.8 via 134.209.96.1 dev eth0 src 134.209.96.193 uid 0
cache
root@wireguard:/etc/wireguard#
```

A terminal window showing the command `ip route get 8.8.8.8` and its output. The output indicates that the network interface `eth0` has Internet access.

Set the value of the `-o` flag on both the `PostUp` and `PostDown` variables to an interface with Internet access, then save the configuration file.

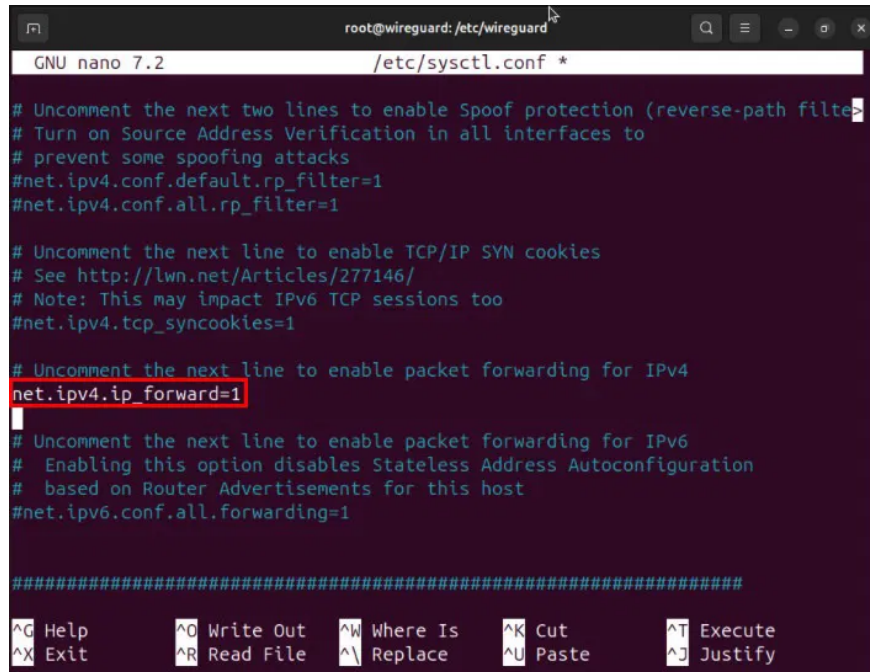

```
GNU nano 7.2          wg0.conf *
[Interface]
PrivateKey = mKw909a83Uly2hzLk66/C0THdYb/V16X2ss4ggM4B1E=
Address = 10.0.0.1/32
ListenPort = 60101
PostUp = iptables -t nat -I POSTROUTING -o eth0 -j MASQUERADE
PostDown = iptables -t nat -D POSTROUTING -o eth0 -j MASQUERADE
```

A terminal window showing the `nano` text editor editing the `wg0.conf` file. The `PostUp` and `PostDown` lines are highlighted, showing the `-o eth0` flag.

Open the server's `/etc/sysctl.conf` file with your favorite text editor:

```
sudo nano /etc/sysctl.conf
```

Scroll down to the line containing **net.ipv4.ip_forward=1** , then remove the pound sign (#) in front.

```
root@wireguard: /etc/wireguard
GNU nano 7.2 /etc/sysctl.conf *
# Uncomment the next two lines to enable Spoof protection (reverse-path filter)
# Turn on Source Address Verification in all interfaces to
# prevent some spoofing attacks
#net.ipv4.conf.default.rp_filter=1
#net.ipv4.conf.all.rp_filter=1

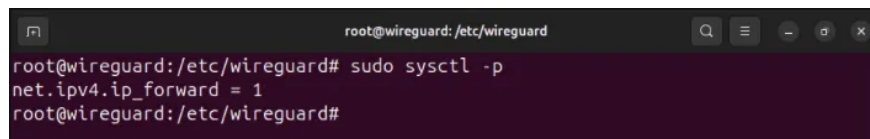

# Uncomment the next line to enable TCP/IP SYN cookies
# See http://lwn.net/Articles/277146/
# Note: This may impact IPv6 TCP sessions too
#net.ipv4.tcp_syncookies=1

# Uncomment the next line to enable packet forwarding for IPv4
net.ipv4.ip_forward=1

# Uncomment the next line to enable packet forwarding for IPv6
# Enabling this option disables Stateless Address Autoconfiguration
# based on Router Advertisements for this host
#net.ipv6.conf.all.forwarding=1

#####
^G Help      ^O Write Out  ^W Where Is   ^K Cut        ^T Execute
^X Exit      ^R Read File  ^\ Replace    ^U Paste      ^J Justify
```

Reload the new sysctl configuration by running: **sudo sysctl -p** .

```
root@wireguard: /etc/wireguard
root@wireguard# sudo sysctl -p
net.ipv4.ip_forward = 1
root@wireguard#
```

Set up and connect the Wireguard client

You now have a properly configured Wireguard server without any peers. To use it, you need to set up and connect your first Wireguard client.

Navigate to the client system's Wireguard configuration directory and set its default permissions:

```
cd /etc/wireguard sudo umask 077
```

Create the client's Wireguard key pair with the following command:

```
sudo sh -c 'wg genkey | tee /etc/wireguard/client1-private-key | wg pubkey > /etc/wireguard/client1-public-key'
```

Create the client's Wireguard configuration file using your favorite text editor:

```
sudo nano /etc/wireguard/wg0.conf
```

Paste the following code block into the client configuration file:

```
[Interface] PrivateKey = PASTE-YOUR-CLIENT1-PRIVATE-KEY-HERE Address = 10.0.0.2/24
```

Replace the PrivateKey variable with the client's private key.

```
root@mte-arch-desktop/etc/wireguard
GNU nano 8.1                               ./wg0.conf                               Modified
[Interface]
PrivateKey = SQQADFQmj+k/OCcpgUcwYnnZR0WKLBWZUTnzezyzrwng=
Address = 10.0.0.2/32
ListenPort = 60101

[Peer]
PublicKey = PASTE-YOUR-SERVER-PUBLIC-KEY-HERE
AllowedIPs = 0.0.0.0/0
Endpoint = PASTE-YOUR-SERVER-IP-ADDRESS-HERE:60101
PersistentKeepalive = 25
```

Open the Wireguard server's terminal session, then print its public key:

```
sudo cat /etc/wireguard/server-public-key
```

Set the value of the PublicKey variable to the server's public key.

```
root@mte-arch-desktop/etc/wireguard
GNU nano 8.1                               ./wg0.conf                               Modified
[Interface]
PrivateKey = SQQADFQmj+k/OCcpgUcwYnnZR0WKLBWZUTnzezyzrwng=
Address = 10.0.0.2/32
ListenPort = 60101

[Peer]
PublicKey = PASTE-YOUR-SERVER-PUBLIC-KEY-HERE
AllowedIPs = 0.0.0.0/0
Endpoint = PASTE-YOUR-SERVER-IP-ADDRESS-HERE:60101
PersistentKeepalive = 25
```

Change the Endpoint variable to the IP address of the Wireguard server.

```
root@mte-arch-desktop/etc/wireguard
GNU nano 8.1                               ./wg0.conf                               Modified
[Interface]
PrivateKey = SQQADFQmj+k/OCcpgUcwYnnZR0WKLBWZUTnzezyzrwng=
Address = 10.0.0.2/32
ListenPort = 60101

[Peer]
PublicKey = jwXkzo4h/whRTrLZjowpUpcYwaagmurA9SA1o0J29zw=
AllowedIPs = 0.0.0.0/0
Endpoint = 134.209.96.193:60101
PersistentKeepalive = 25
```

Save the configuration file, then use the wg-quick command to start the Wireguard client:

```
sudo wg-quick up wg0
```

```
root@mte-arch-desktop/etc/wireguard
GNU nano 8.1                               ./wg0.conf                               Modified
[Interface]
PrivateKey = SQQADFQmj+k/OCcpgUcwYnnZR0WKLBWZUTnzezyzrwng=
Address = 10.0.0.2/32
ListenPort = 60101

[Peer]
PublicKey = jwXkzo4h/whRTrLZjowpUpcYwaagmurA9SA1o0J29zw=
AllowedIPs = 0.0.0.0/0
Endpoint = 134.209.96.193:60101
PersistentKeepalive = 25
```

Note : This command will disable the client's network connection until you start the Wireguard server. To get back to the original network, run **sudo wg-quick down wg0** .

Link the Wireguard server to the client

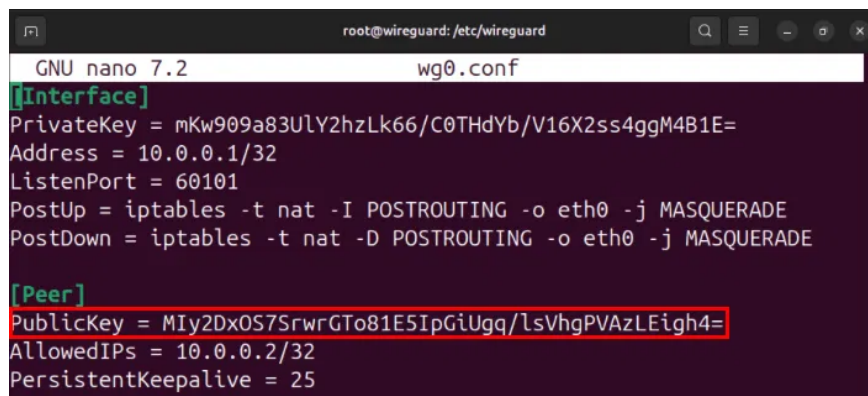

Access the Wireguard server's terminal session, then open the server's configuration file:

```
sudo nano /etc/wireguard/wg0.conf
```

Paste the following block of code after the [Interface] section:

```
[Peer] PublicKey = PASTE-YOUR-CLIENT1-PUBLIC-KEY-HERE AllowedIPs = 10.0.0.2/32 P
```

Set the PublicKey variable to the Wireguard client's public key.

```
root@wireguard: /etc/wireguard
GNU nano 7.2          wg0.conf
[Interface]
PrivateKey = mKw909a83Uly2hzLk66/C0THdYb/V16X2ss4ggM4B1E=
Address = 10.0.0.1/32
ListenPort = 60101
PostUp = iptables -t nat -I POSTROUTING -o eth0 -j MASQUERADE
PostDown = iptables -t nat -D POSTROUTING -o eth0 -j MASQUERADE

[Peer]
PublicKey = MIy2Dx0S7SrwrGT081E5IpGiUgq/lsVhgPVAzLEigh4=
AllowedIPs = 10.0.0.2/32
PersistentKeepalive = 25
```

Note : You can get the public key by running **sudo cat /etc/wireguard/client1-public-key** on your client.

Save the configuration file, then run the following command to start the Wireguard service on the server:

```
sudo wg-quick up wg0
```
